# The State of the Art in Visualizing Multivariate Networks

C. Nobre<sup>1</sup>, M. Meyer<sup>1</sup>, M. Streit<sup>2</sup>, and A. Lex<sup>1</sup>

<sup>1</sup>University of Utah, Utah, USA

<sup>2</sup>Johannes Kepler University Linz, Austria

**Figure 1:** A typology of operations and layouts used in multivariate network visualization. *Layouts* describe the fundamental choices for encoding multivariate networks. *View Operations* capture how topology and attribute focused visualizations can be combined. *Layout Operations* are applied to basic layouts to create specific visualization techniques. *Data Operations* are used to transform a network or derive attributes before visualizations. The colors reflect node attributes (orange), edge attributes (purple), and topology (grey).

## Abstract

Multivariate networks are made up of nodes and their relationships (links), but also data about those nodes and links as attributes. Most real-world networks are associated with several attributes, and many analysis tasks depend on analyzing both, relationships and attributes. Visualization of multivariate networks, however, is challenging, especially when both the topology of the network and the attributes need to be considered concurrently. In this state-of-the-art report, we analyze current practices and classify techniques along four axes: layouts, view operations, layout operations, and data operations. We also provide an analysis of tasks specific to multivariate networks and give recommendations for which technique to use in which scenario. Finally, we survey application areas and evaluation methodologies.

On-Node / On-Edge  
Encoding

*Nielsen, 2009*

On-Node / On-Edge  
Encoding

*Schöffel et al, 2016*

Is easily understood by most users  
Works well for all types of networks

Scalability.  
Node size leaves little space to encode attributes.

On-Node / On-Edge  
Encoding

*Recommended for small networks when only a few (usually under five) attributes on the nodes are shown, or in combination with a zooming/filtering strategy*

# Attribute-Driven Faceting

A large, empty, light gray rounded rectangular box for notes or information related to the Coca-Cola can.

A large, empty, light gray rounded rectangular box for notes or information related to the beer bottle.

A large, empty, light gray rounded rectangular box for notes or information related to the Porto bottle.

On-Node / On-Edge  
Encoding

Attribute-Driven  
Faceting

# Cerebral Barskey et al. 2008

On-Node / On-Edge  
Encoding

Attribute-Driven  
Faceting

Well suited for networks with different node types or with an important categorical or set-like attribute.

Attribute-Driven  
Faceting

Less scalable with respect to the number of nodes and network density than node-link layouts.

Neighborhoods, paths, and clusters are not easily visible if they span different facets.

*Recommended for networks where nodes can be separated into groups easily and where these groups are central to the analysis*

# Attribute-Driven Positioning

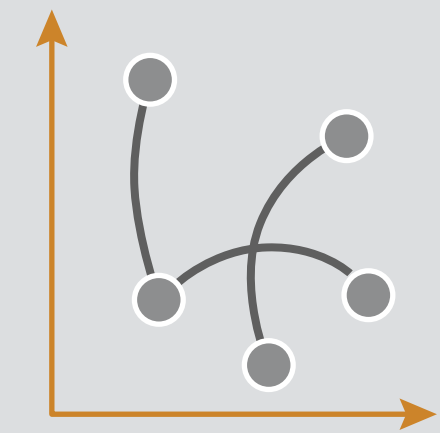

# Graph Dice *Bezerianos et al. 2010*

On-Node / On-Edge  
Encoding

Attribute-Driven  
Positioning

# Edge Map *Dork et al. 2011*

Querying and Filtering

On-Node / On-Edge Encoding

Attribute-Driven Positioning 72

Well suited for quantitative attributes

Does not lend itself well to visualizing the topology of the network.

Attribute-Driven Positioning

*Recommended for smaller, sparse networks where relationships between node attributes are paramount to the analysis task, and topological features only provide context*

## A grammar of graphics for relational data

`ggraph` is an extension of `ggplot2` aimed at supporting relational data structures such as networks, graphs, and trees. While it builds upon the foundation of `ggplot2` and its API it comes with its own self-contained set of geoms, facets, etc., as well as adding the concept of *layouts* to the grammar.

## Software for complex networks

NetworkX is a Python package for the creation, manipulation, and study of the structure, dynamics, and functions of complex networks.

### Features

- Data structures for graphs, digraphs, and multigraphs
- Many standard graph algorithms
- Network structure and analysis measures
- Generators for classic graphs, random graphs, and synthetic networks
- Nodes can be "anything" (e.g., text, images, XML records)
- Edges can hold arbitrary data (e.g., weights, time-series)
- Open source [3-clause BSD license](#)
- Well tested with over 90% code coverage
- Additional benefits from Python include fast prototyping, easy to teach, and multi-platform

# Les Misérables Co-occurrence

Order:

This matrix diagram visualizes character co-occurrences in Victor Hugo's *Les Misérables*.

Each colored cell represents two characters that appeared in the same chapter; darker cells indicate characters that co-occurred more frequently.

Use the drop-down menu to reorder the matrix and explore the data.

Built with d3.js.

Jean-Daniel Fekete edited this page on Apr 23, 2015 · 2 revisions

Reorder.js is a library to reorder tables and graph/networks.

## Resources

- [Introduction](#)
- [API Reference](#)

## Browser / Platform Support

Reorder.js is mainly developed on Chrome and [Node.js](#). Use `npm install reorder.js` to install, and `require("reorder")` to load.

## Installing

Download the latest version here:

- <https://github.com/jdfekete/reorder.js/releases>

E		■				■

Adjacency  
Matrix

Ideal for dense and completely connected networks

Requires quadratic space with respect to the number of nodes.

Complexity of choosing the right reordering algorithm

	A	B	C	D	E	
A	■					■
B						■
C	■			■		■
D			■		■	■
E		■				■

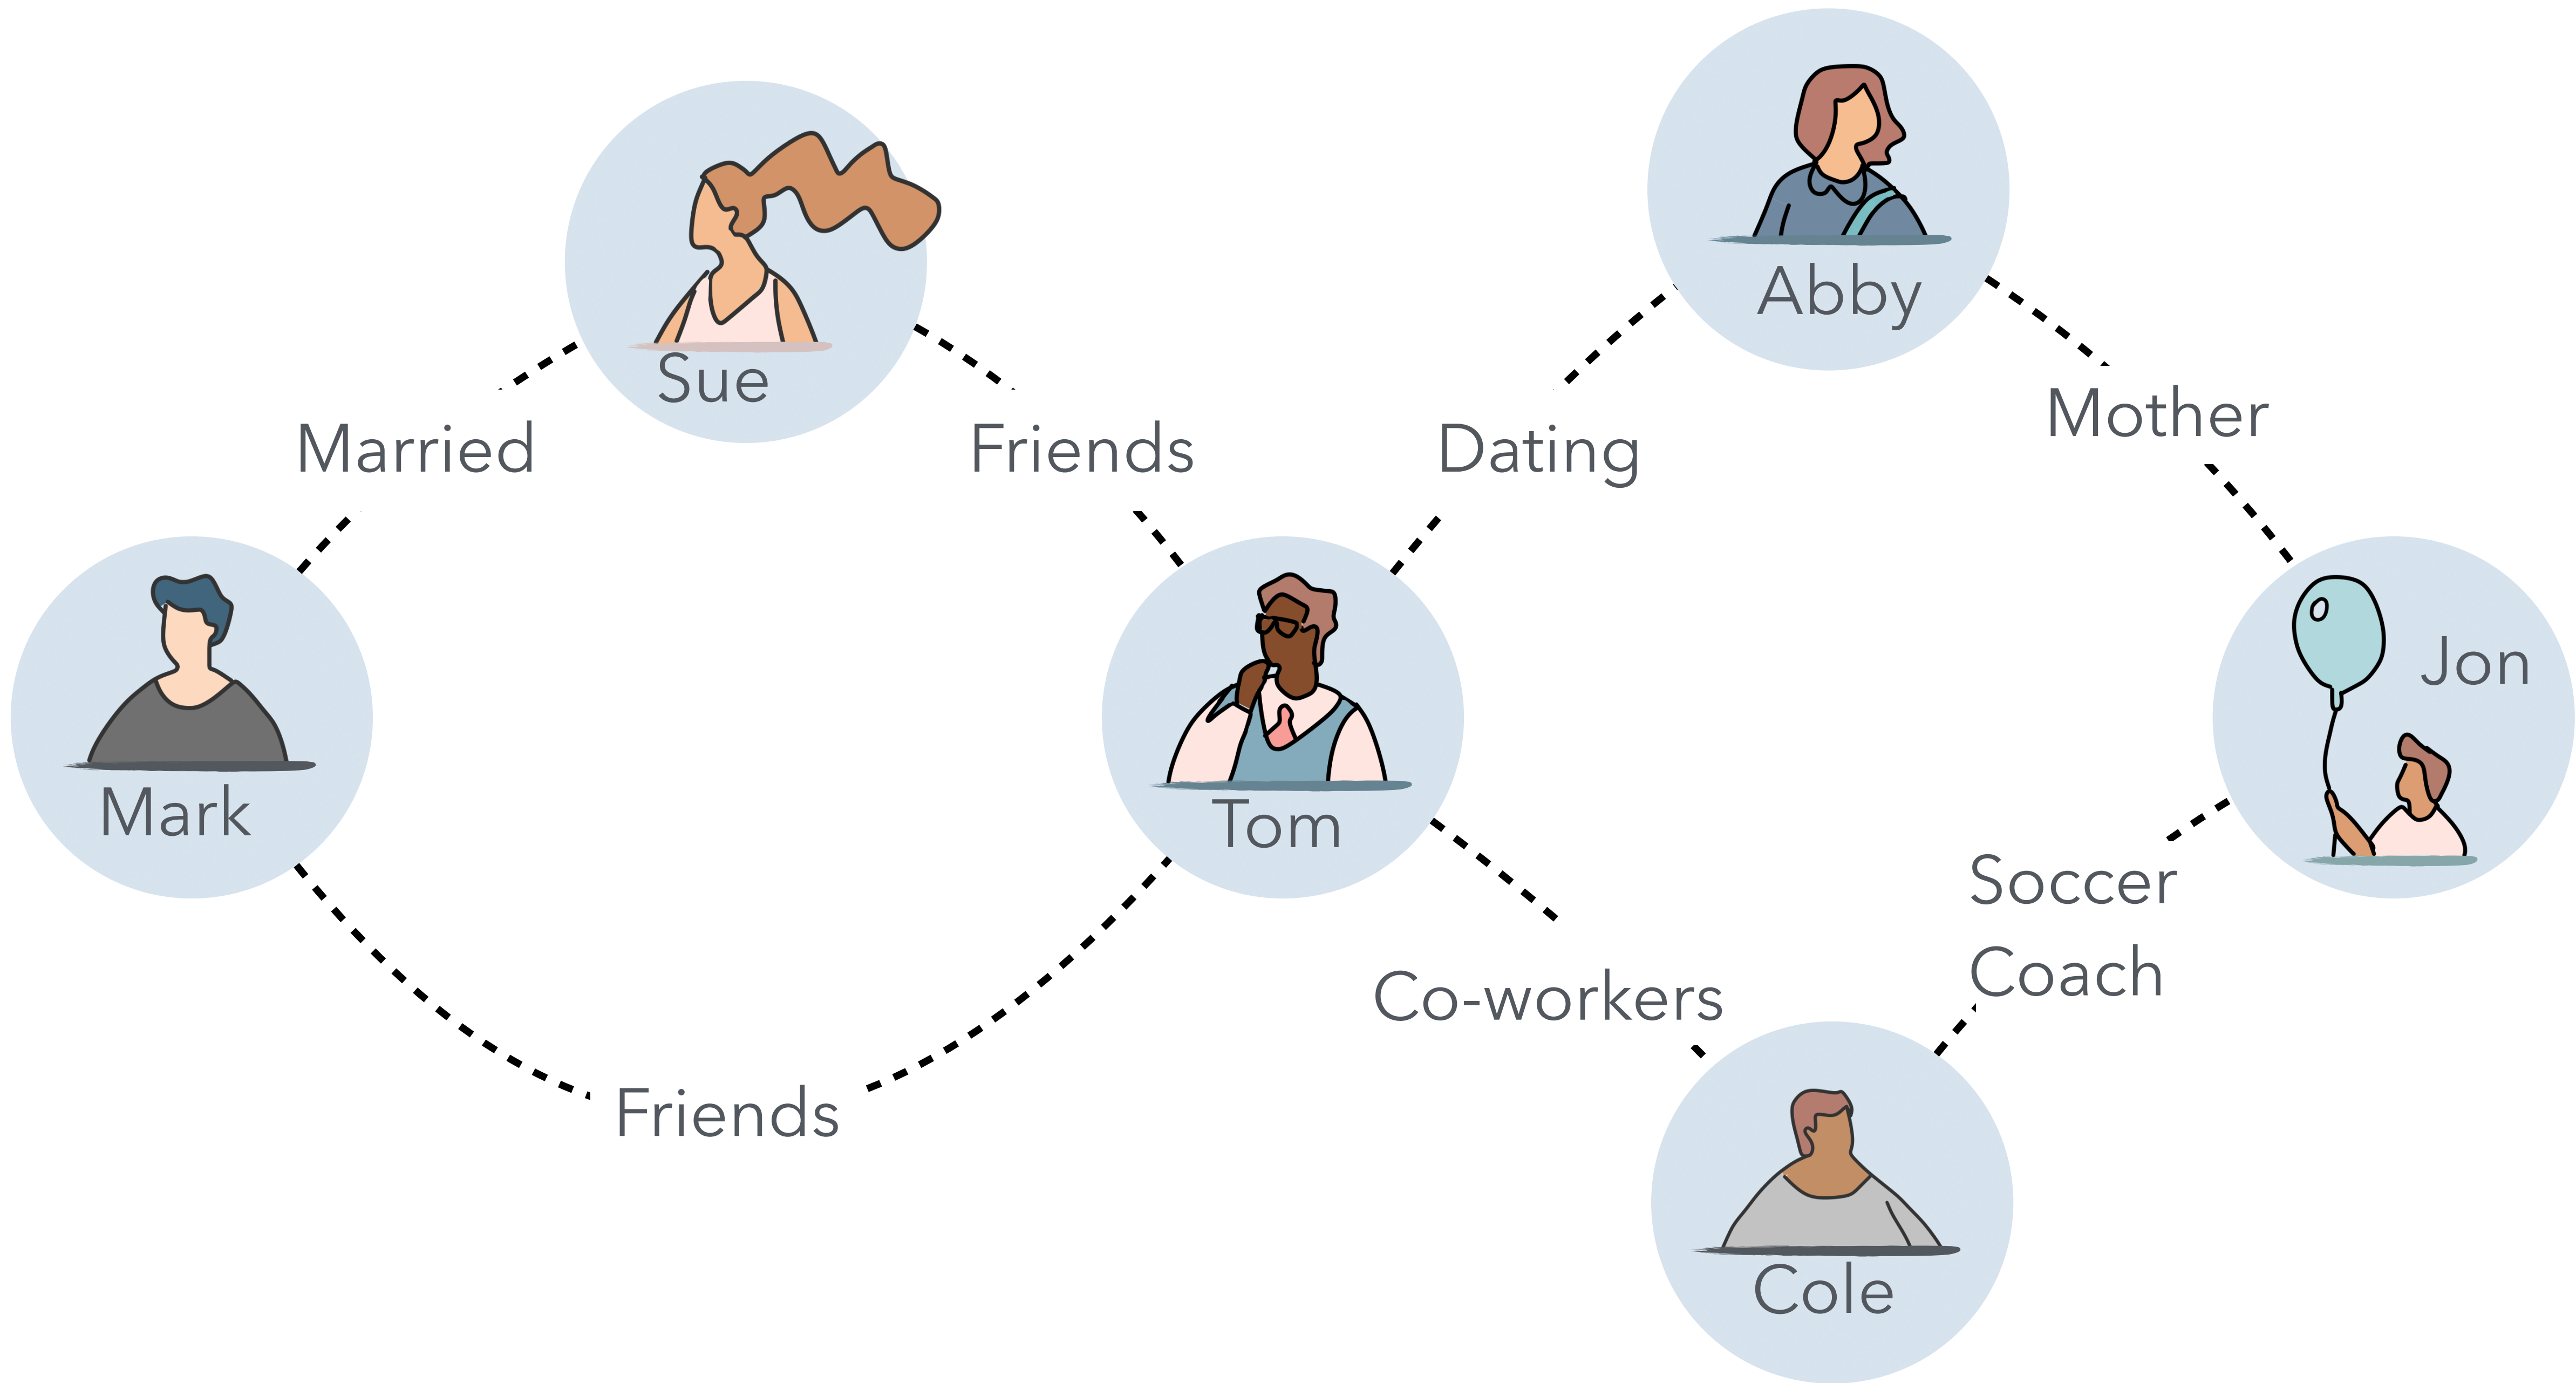

Adjacency Matrix

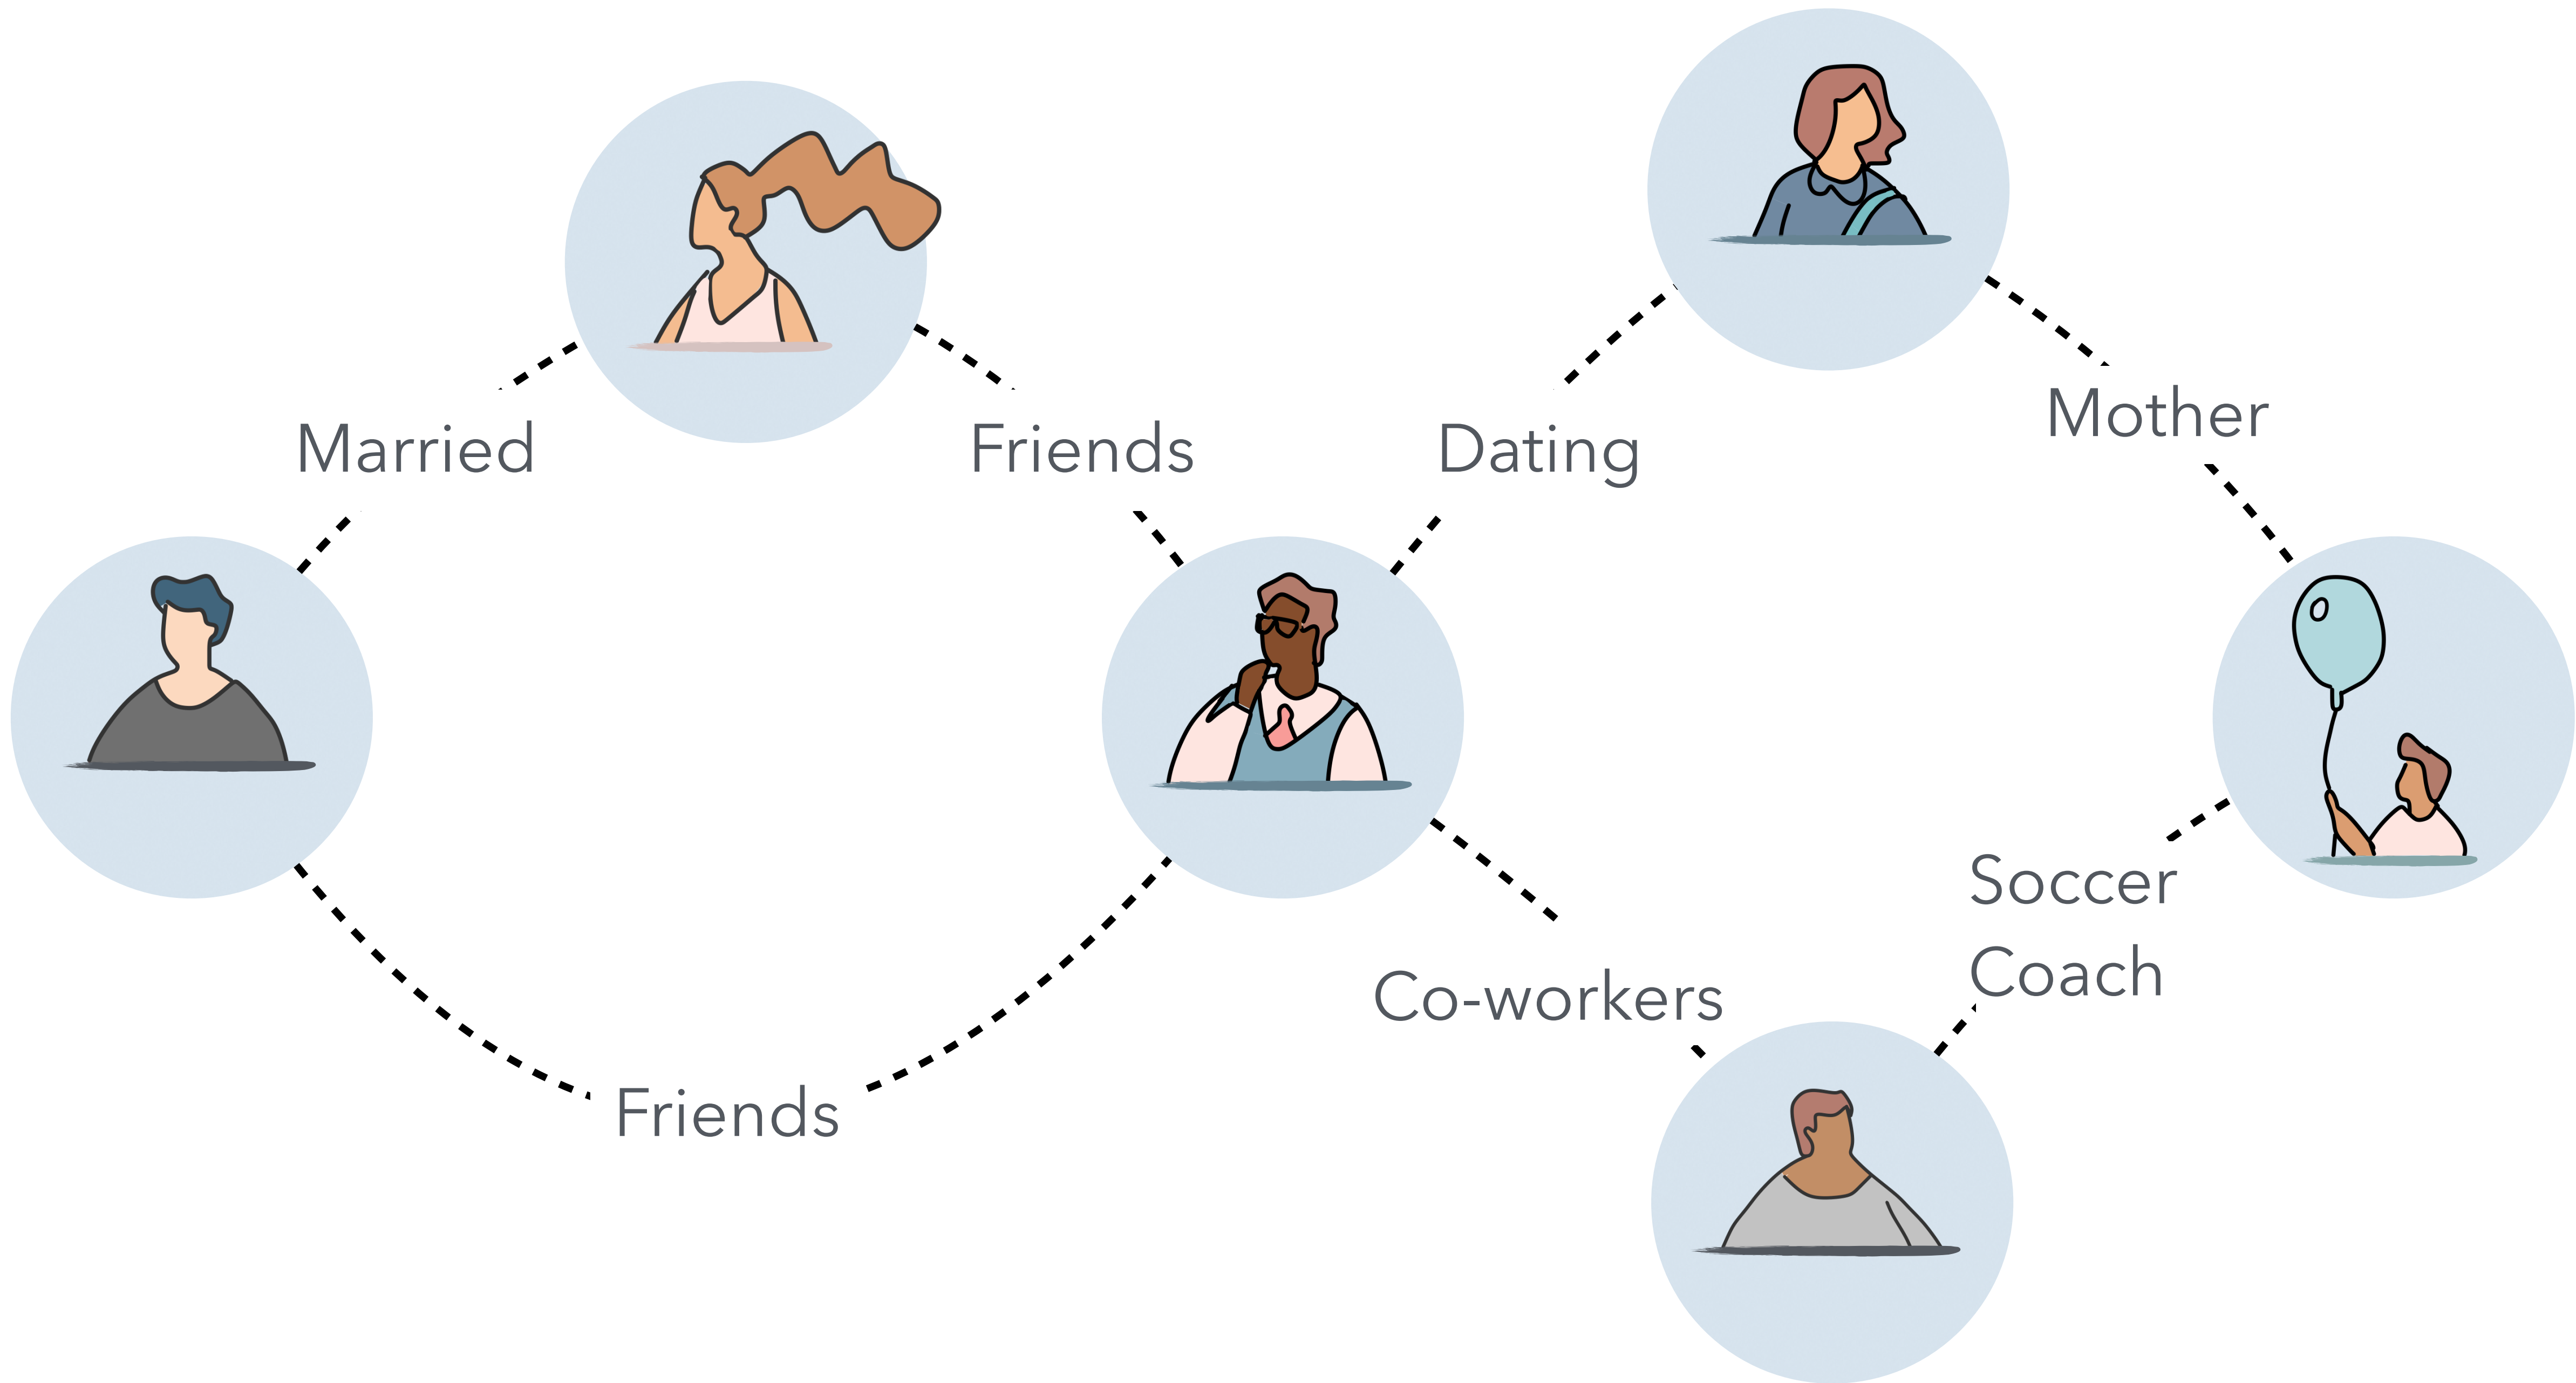

*Recommended for smaller, complex and dense networks with rich node and/or edge attributes, for all tasks except for those involving paths*

# Quilts

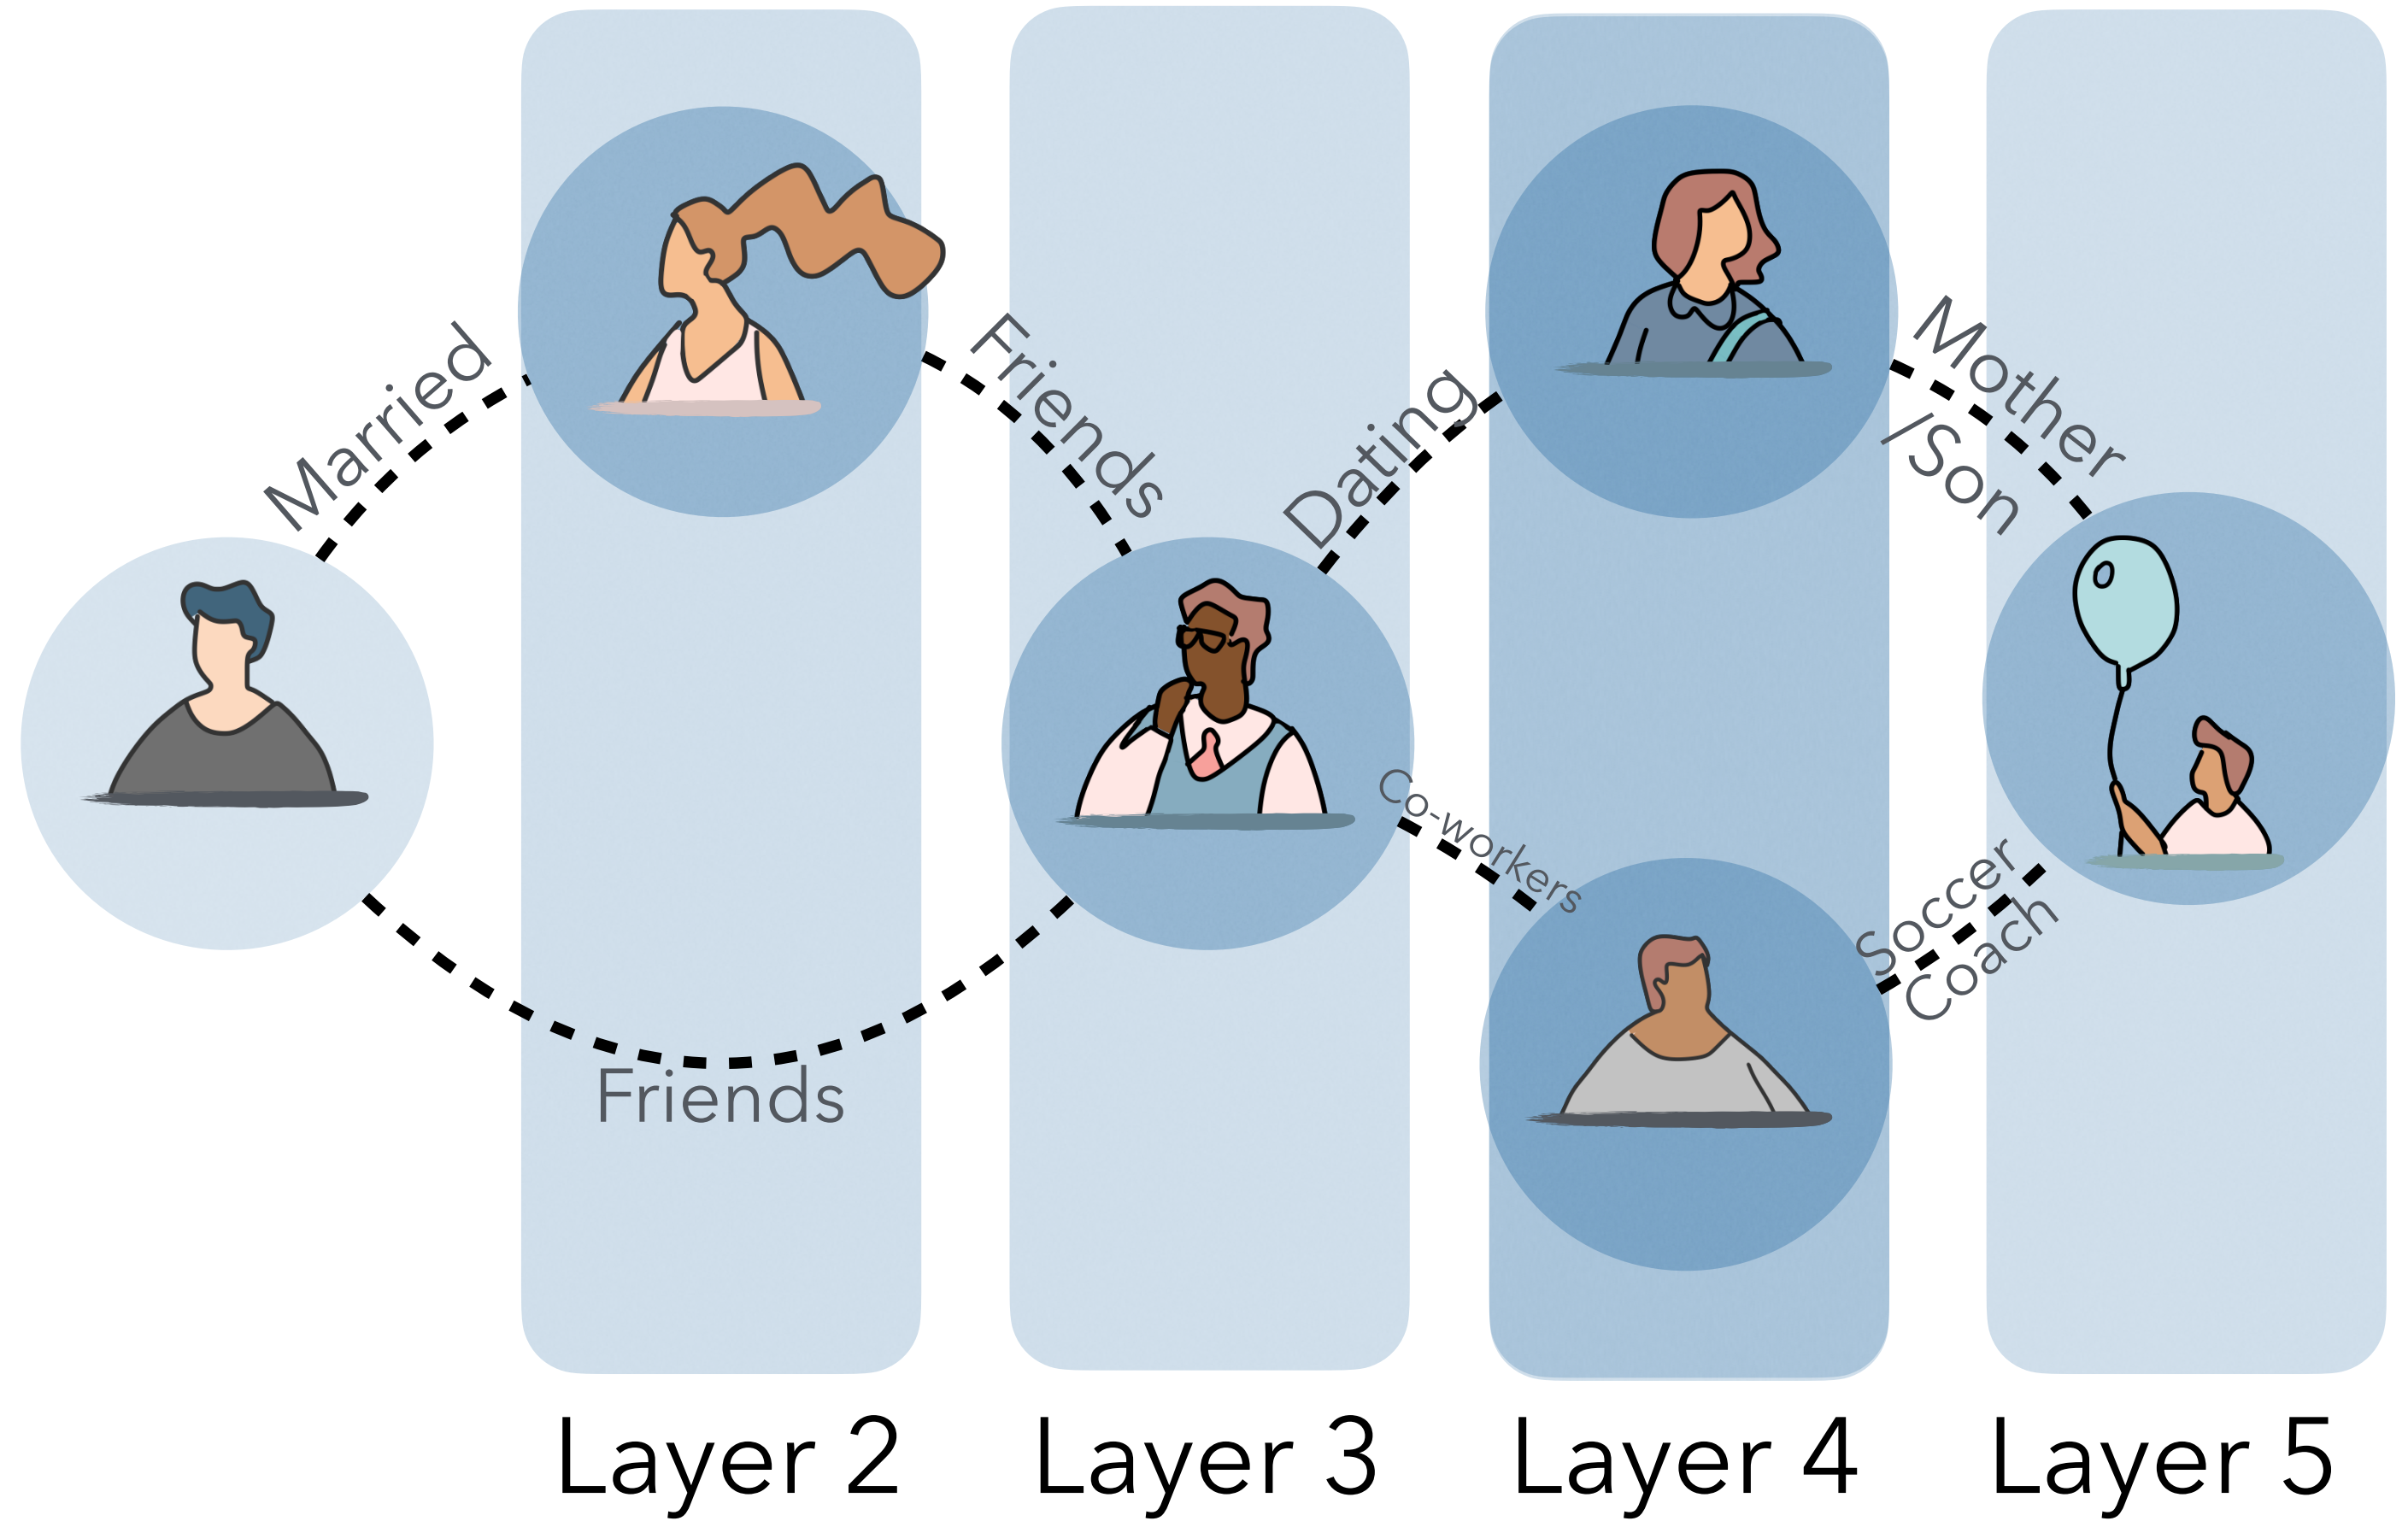

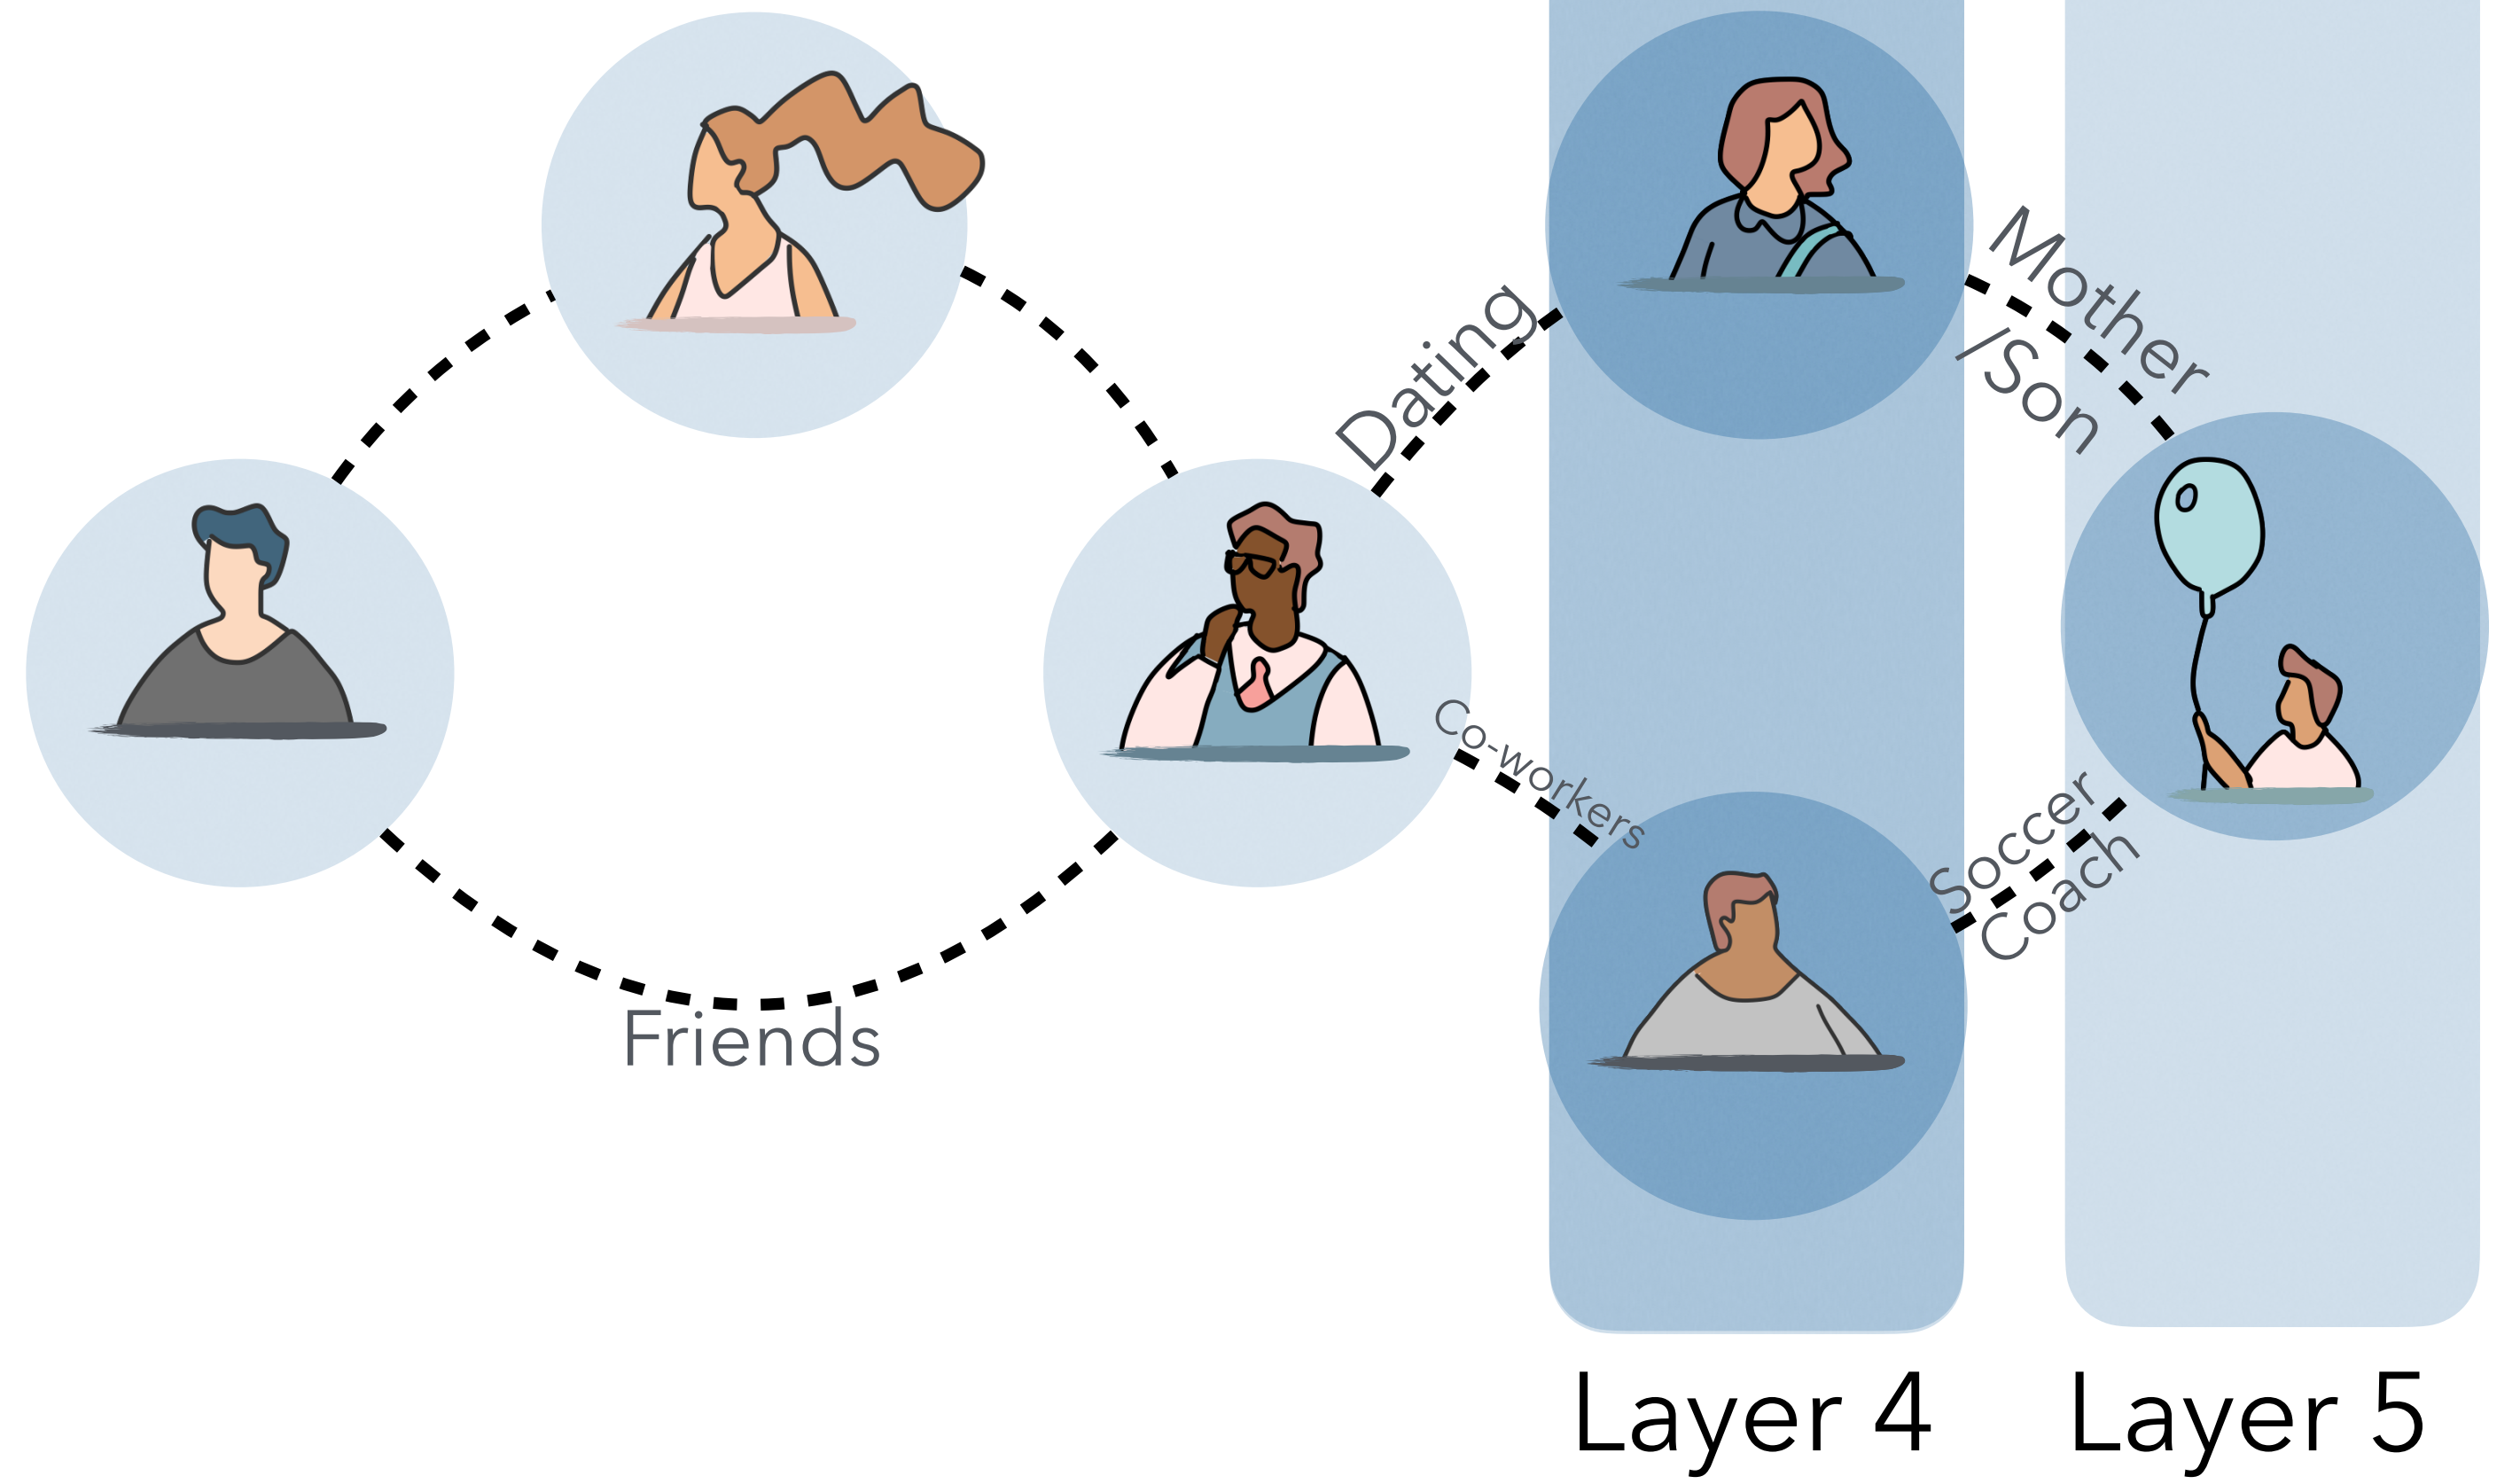

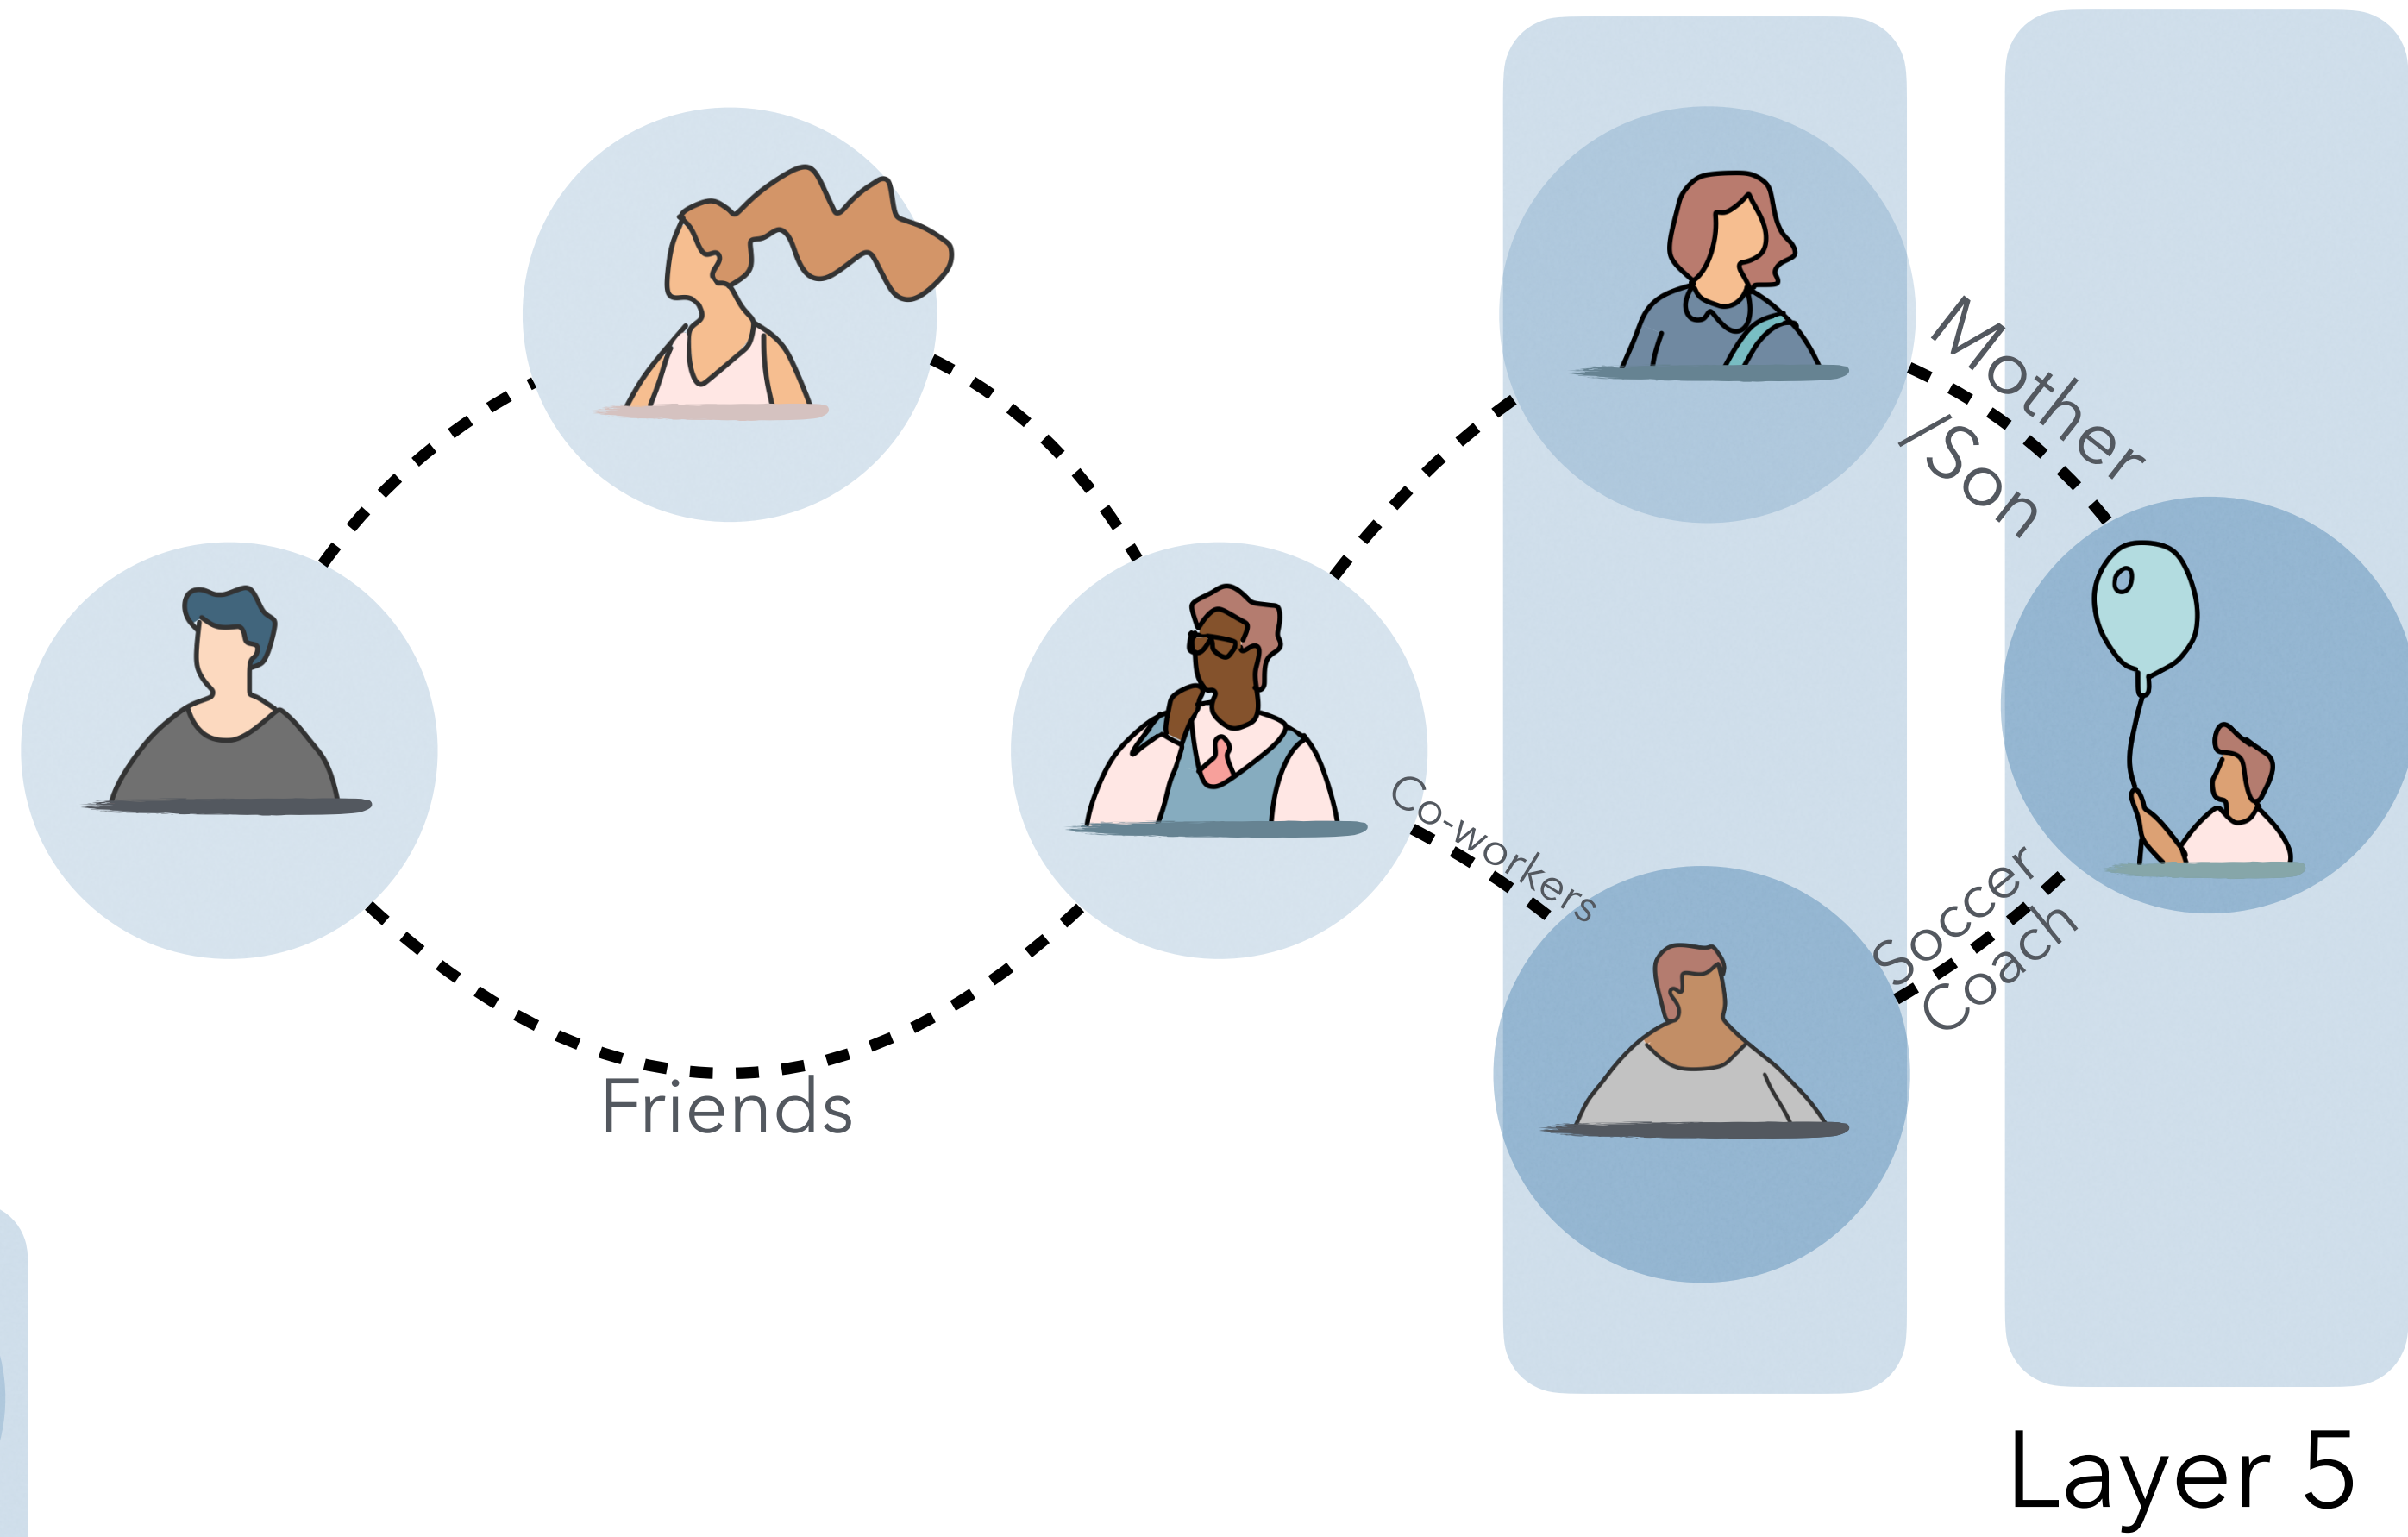

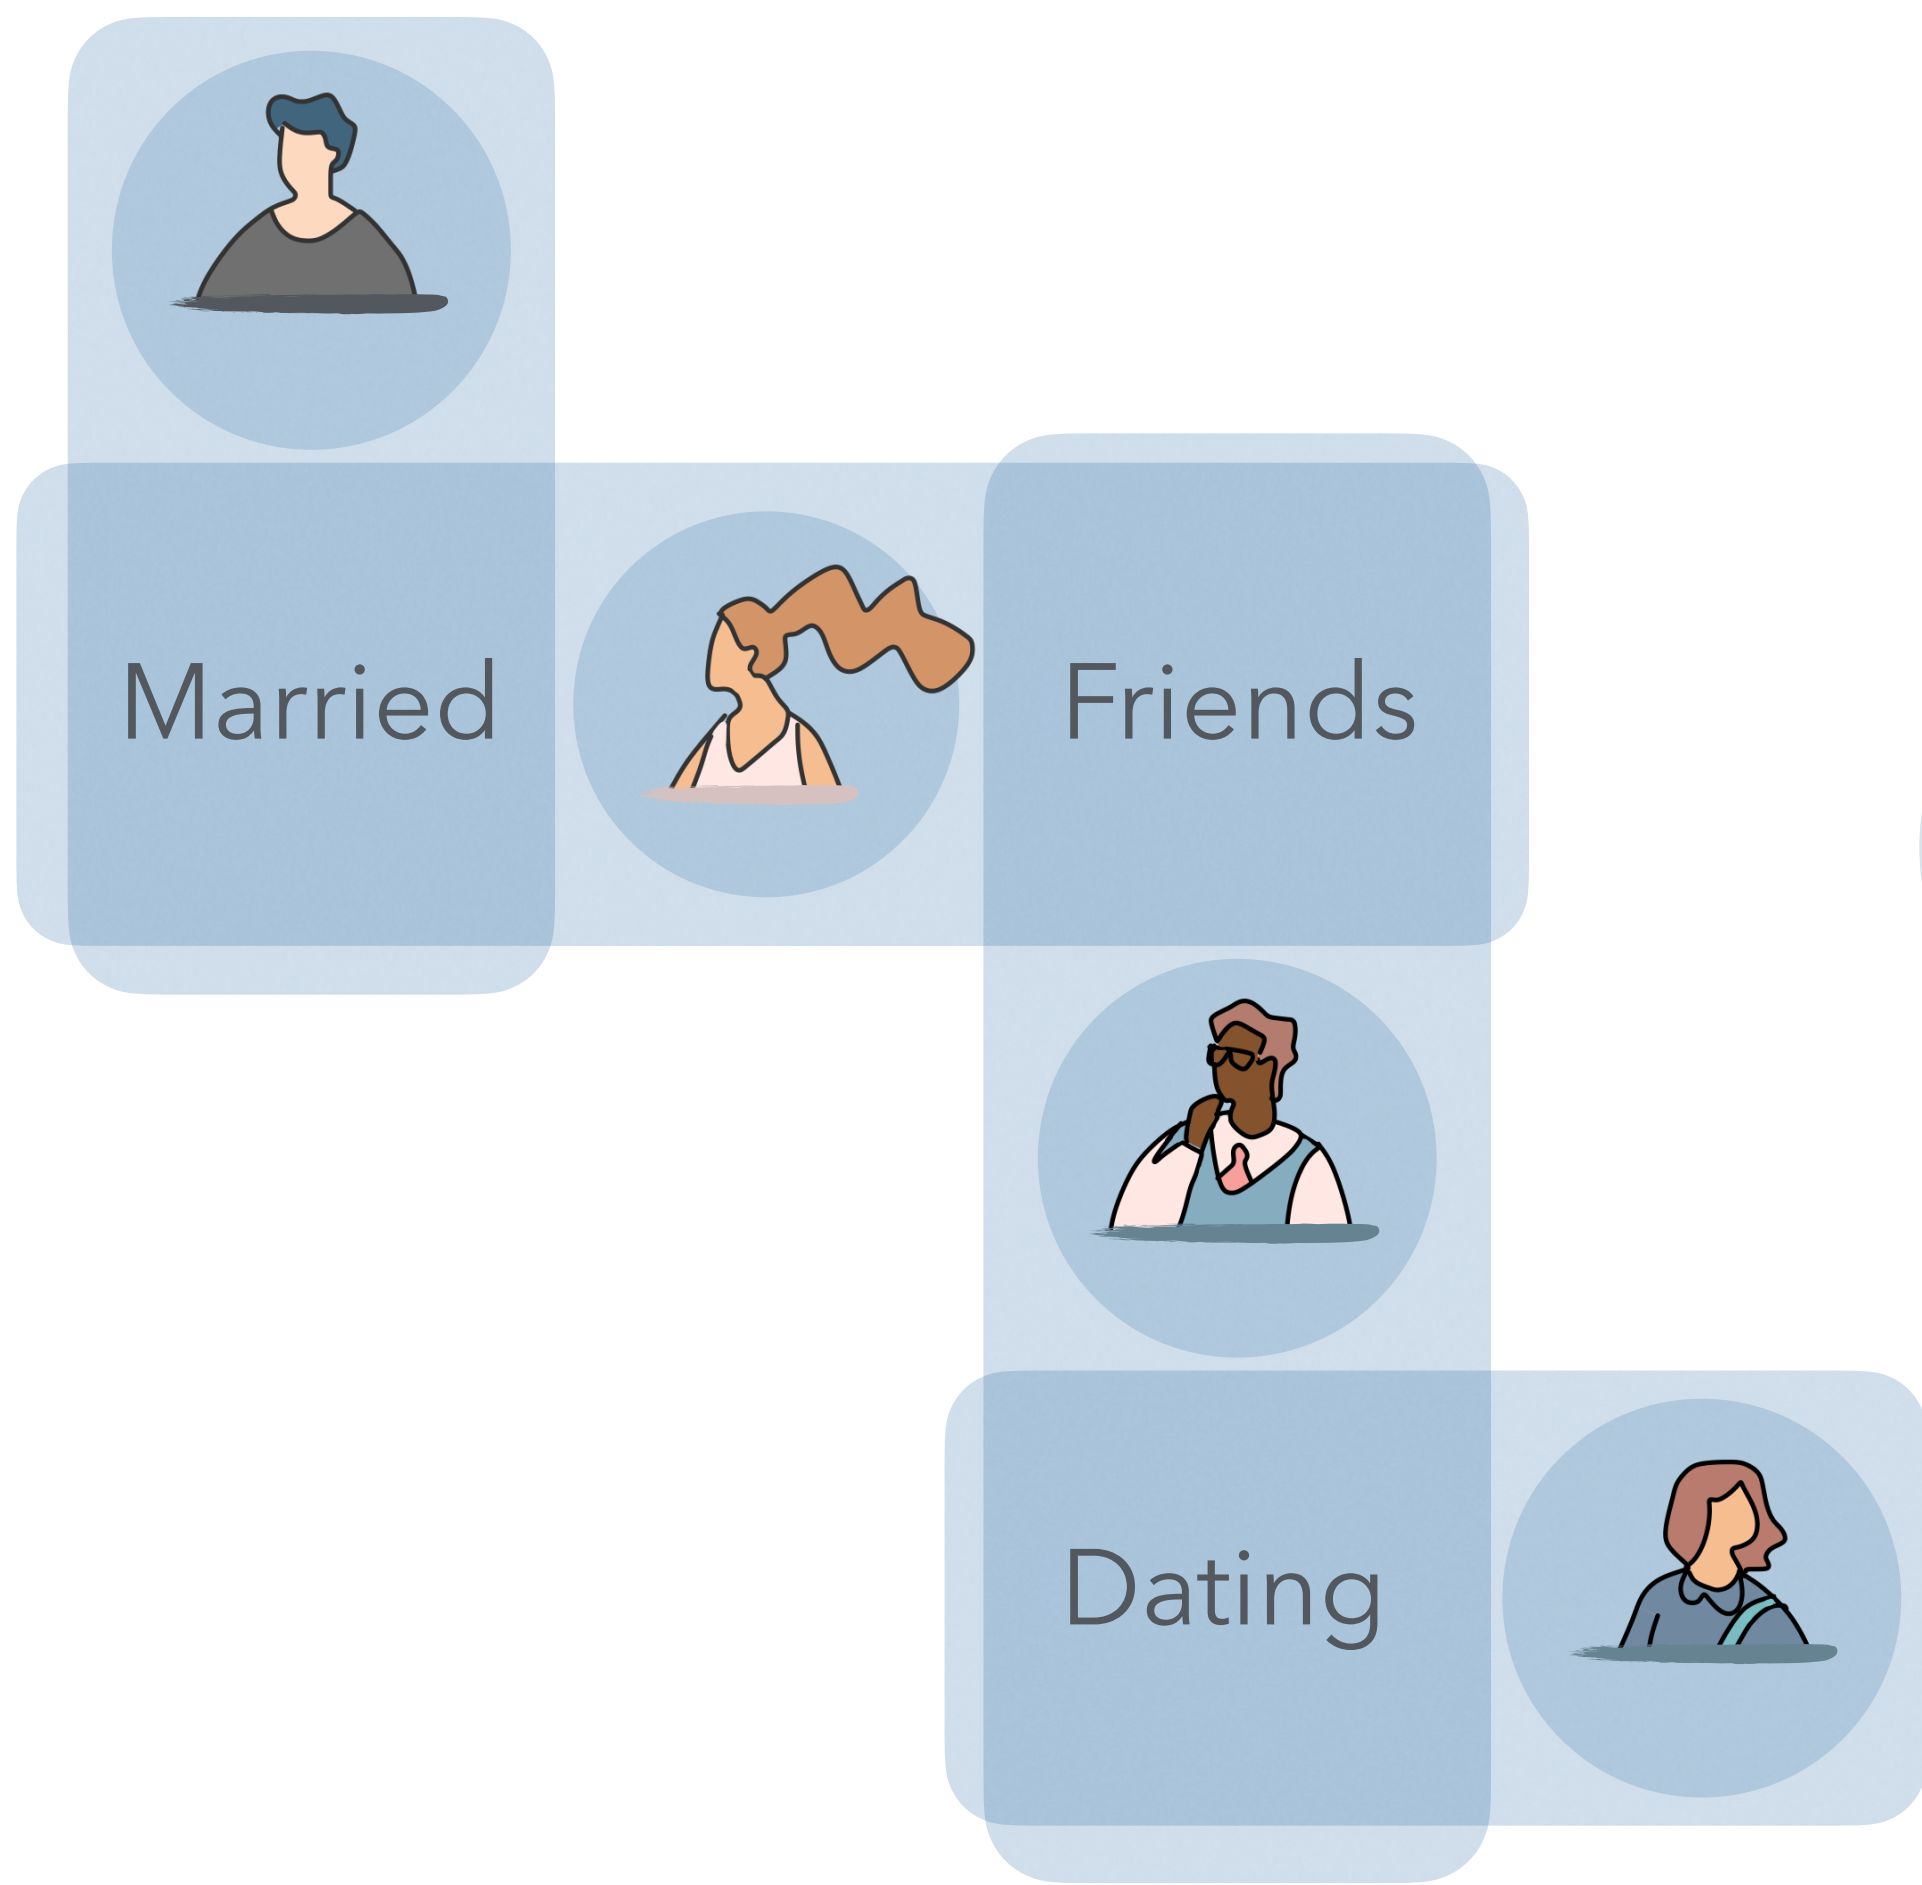

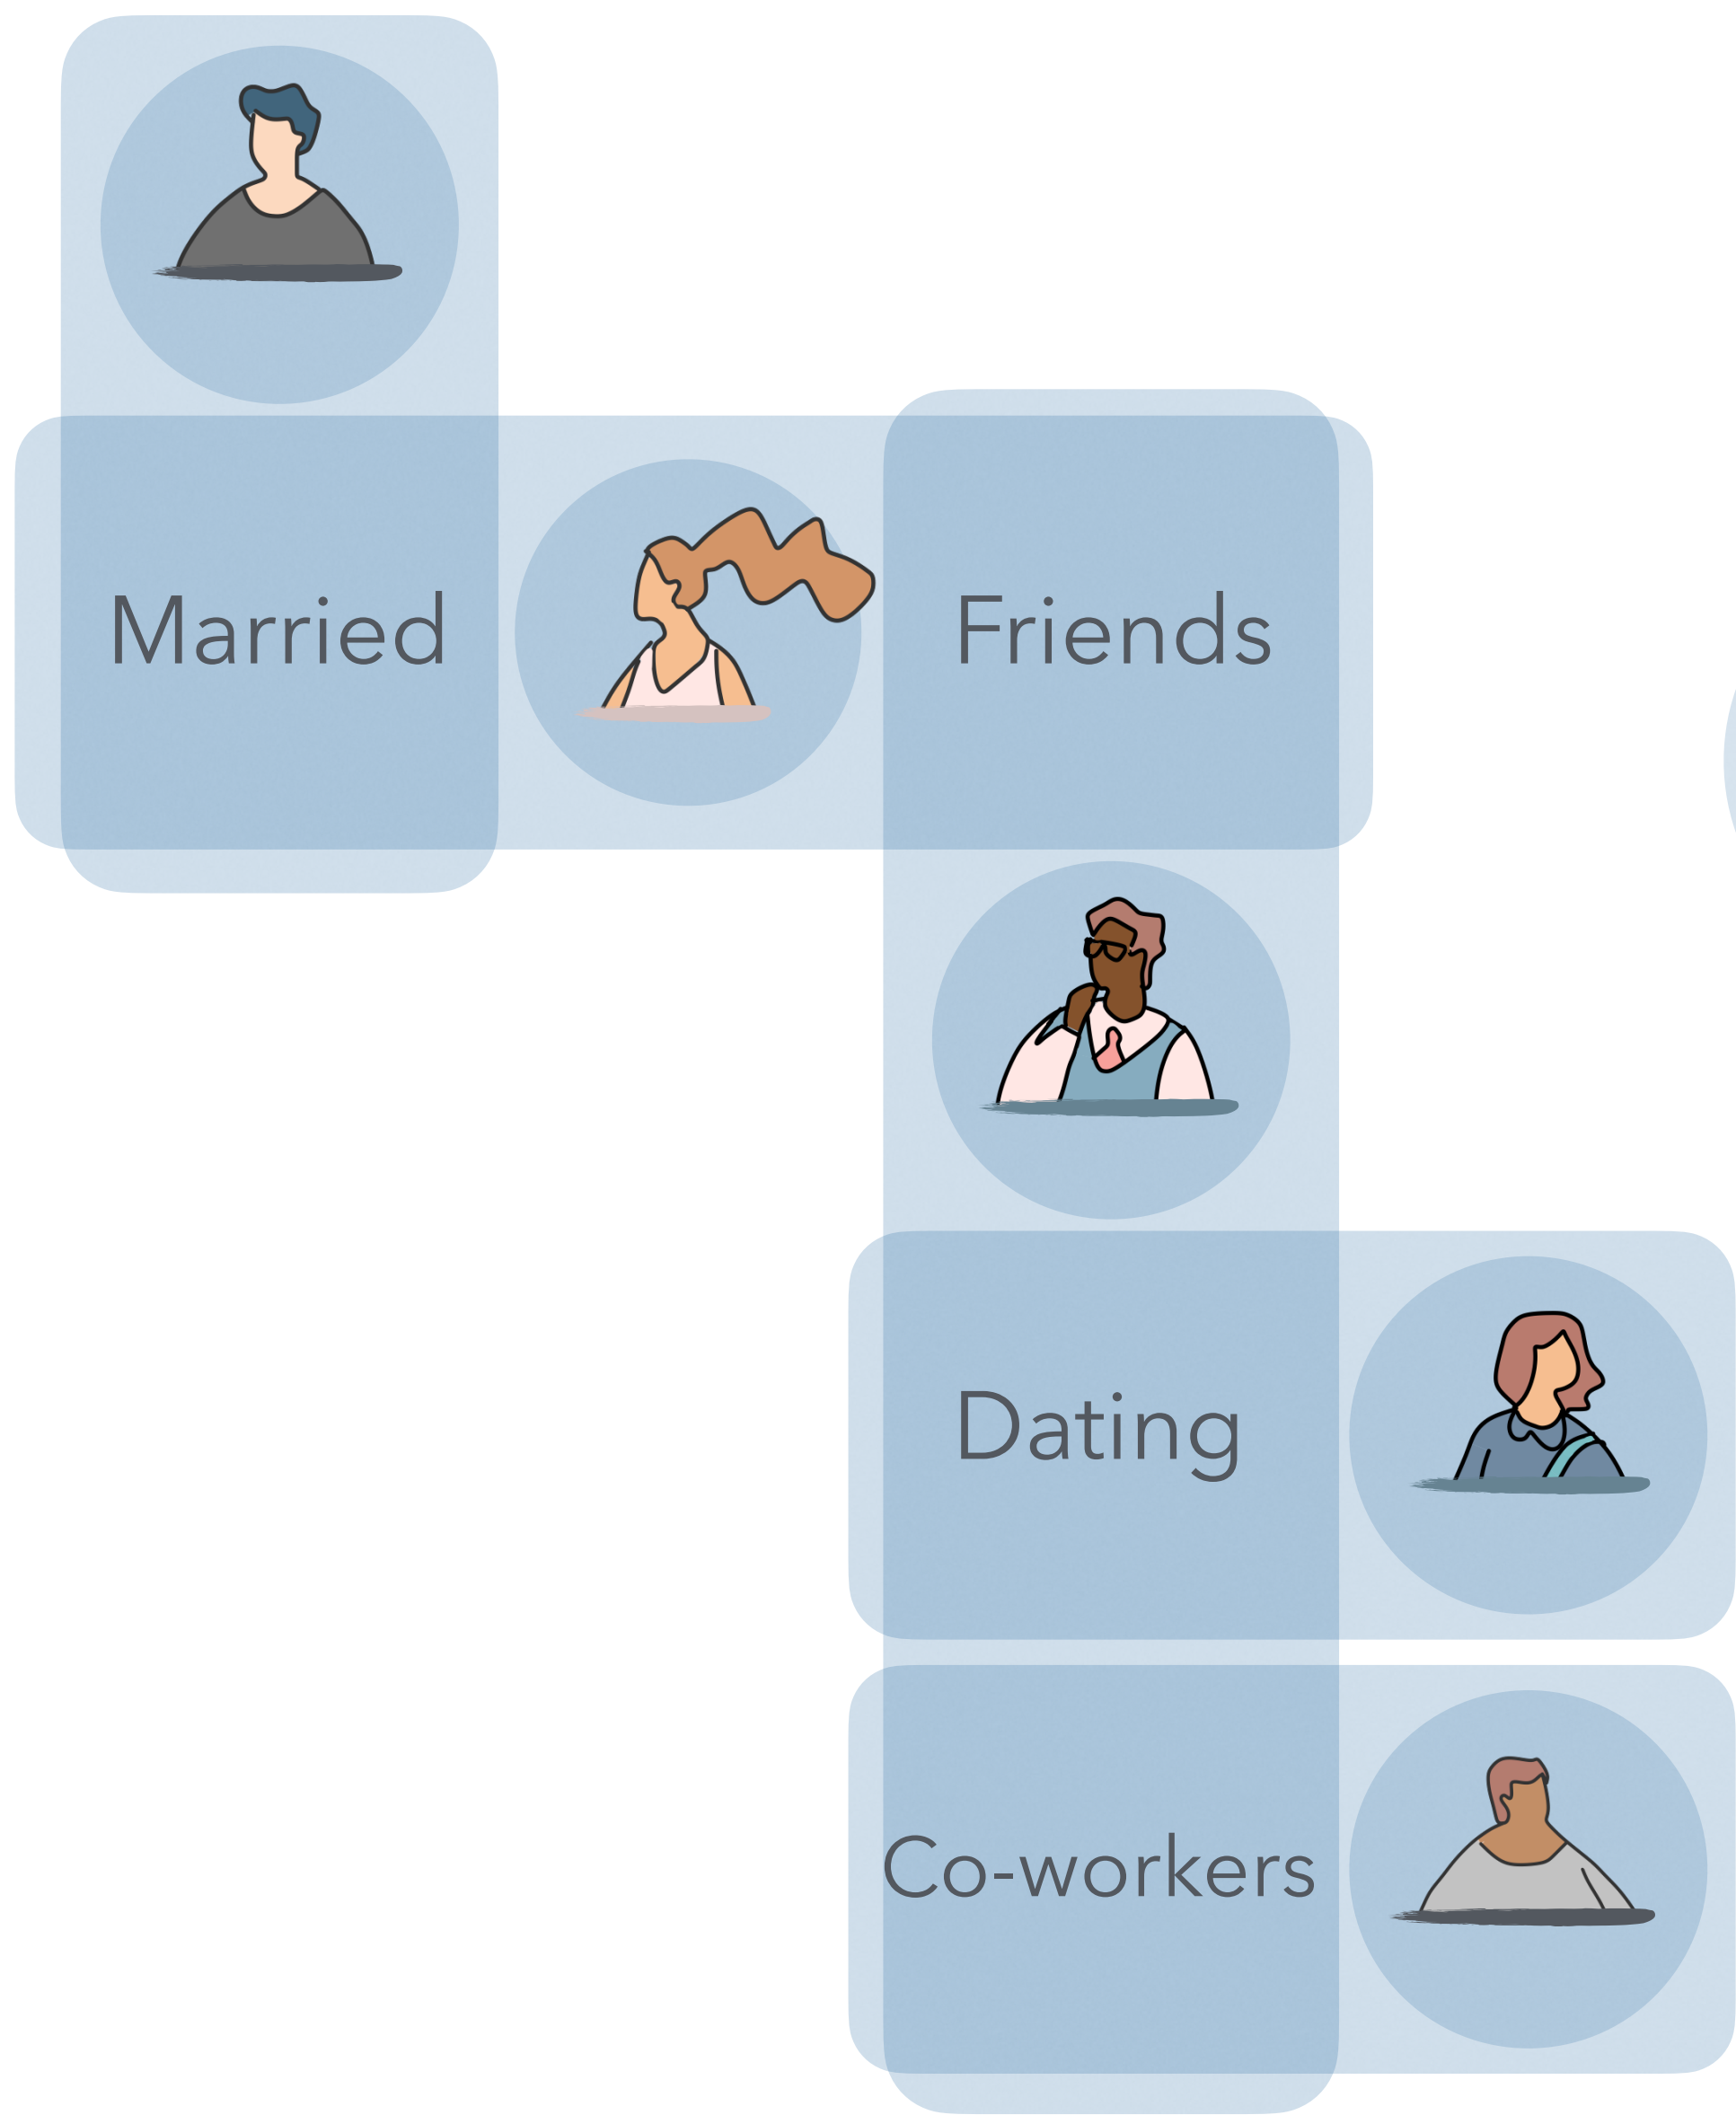

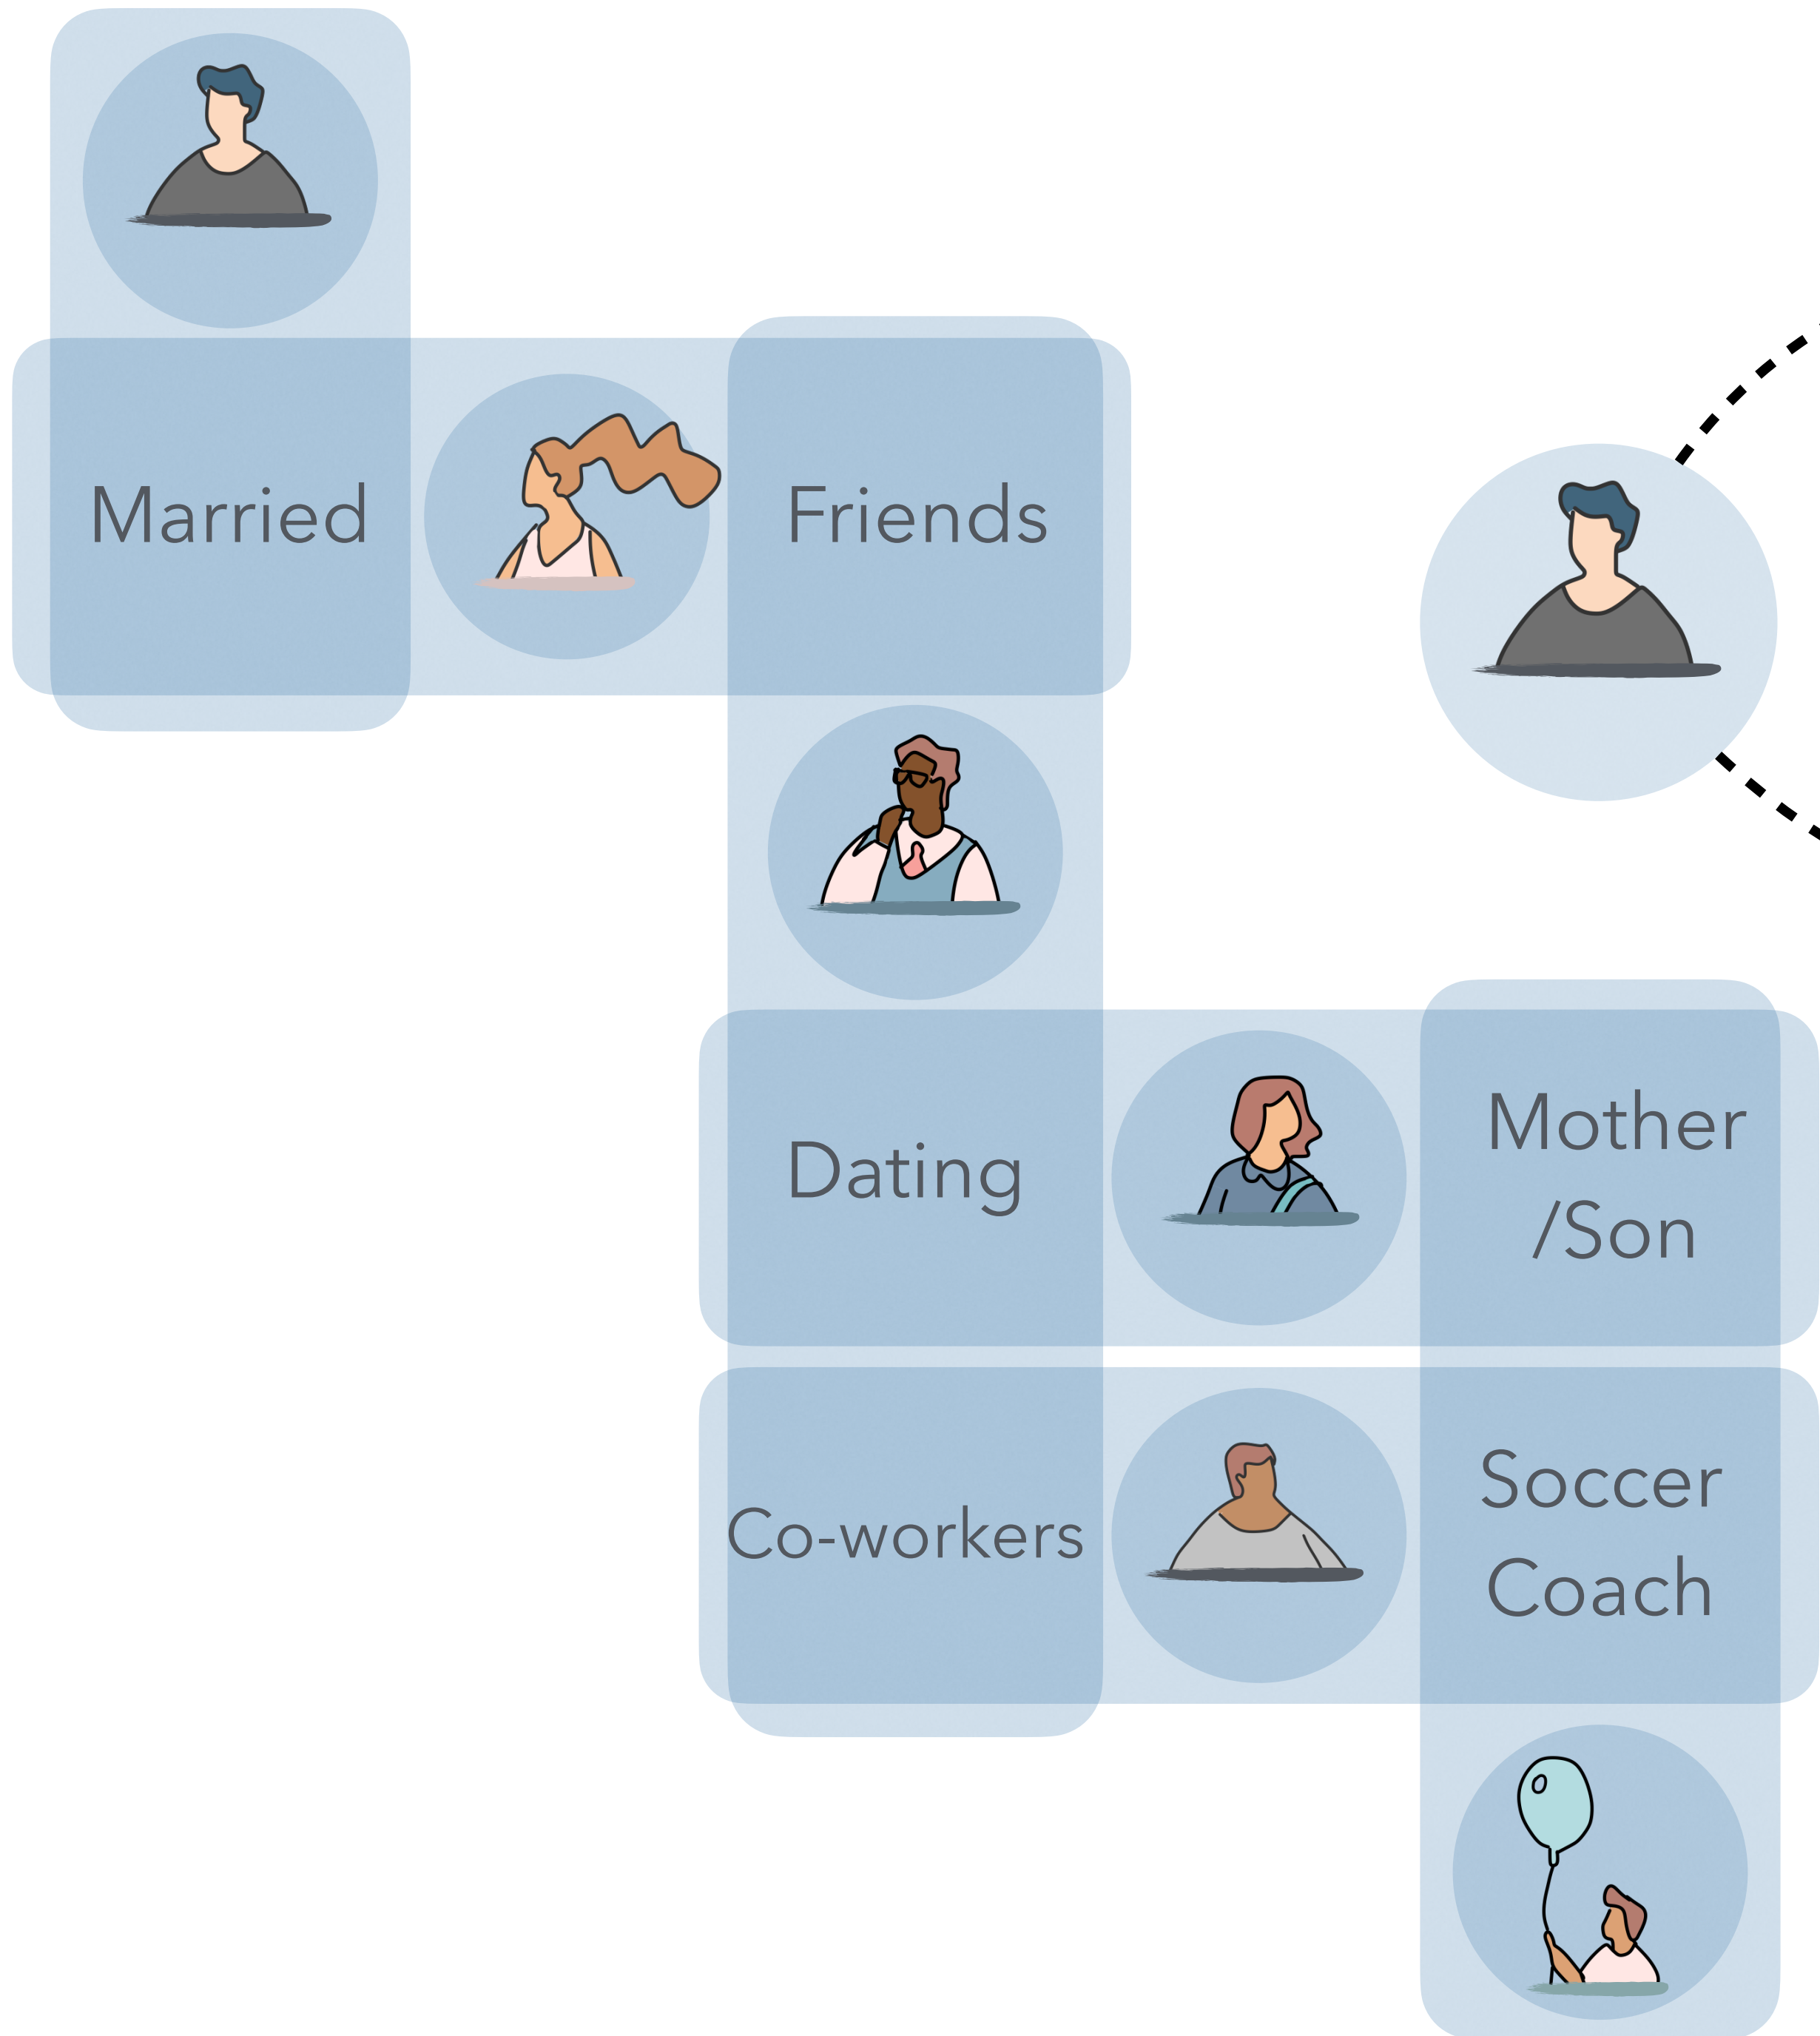

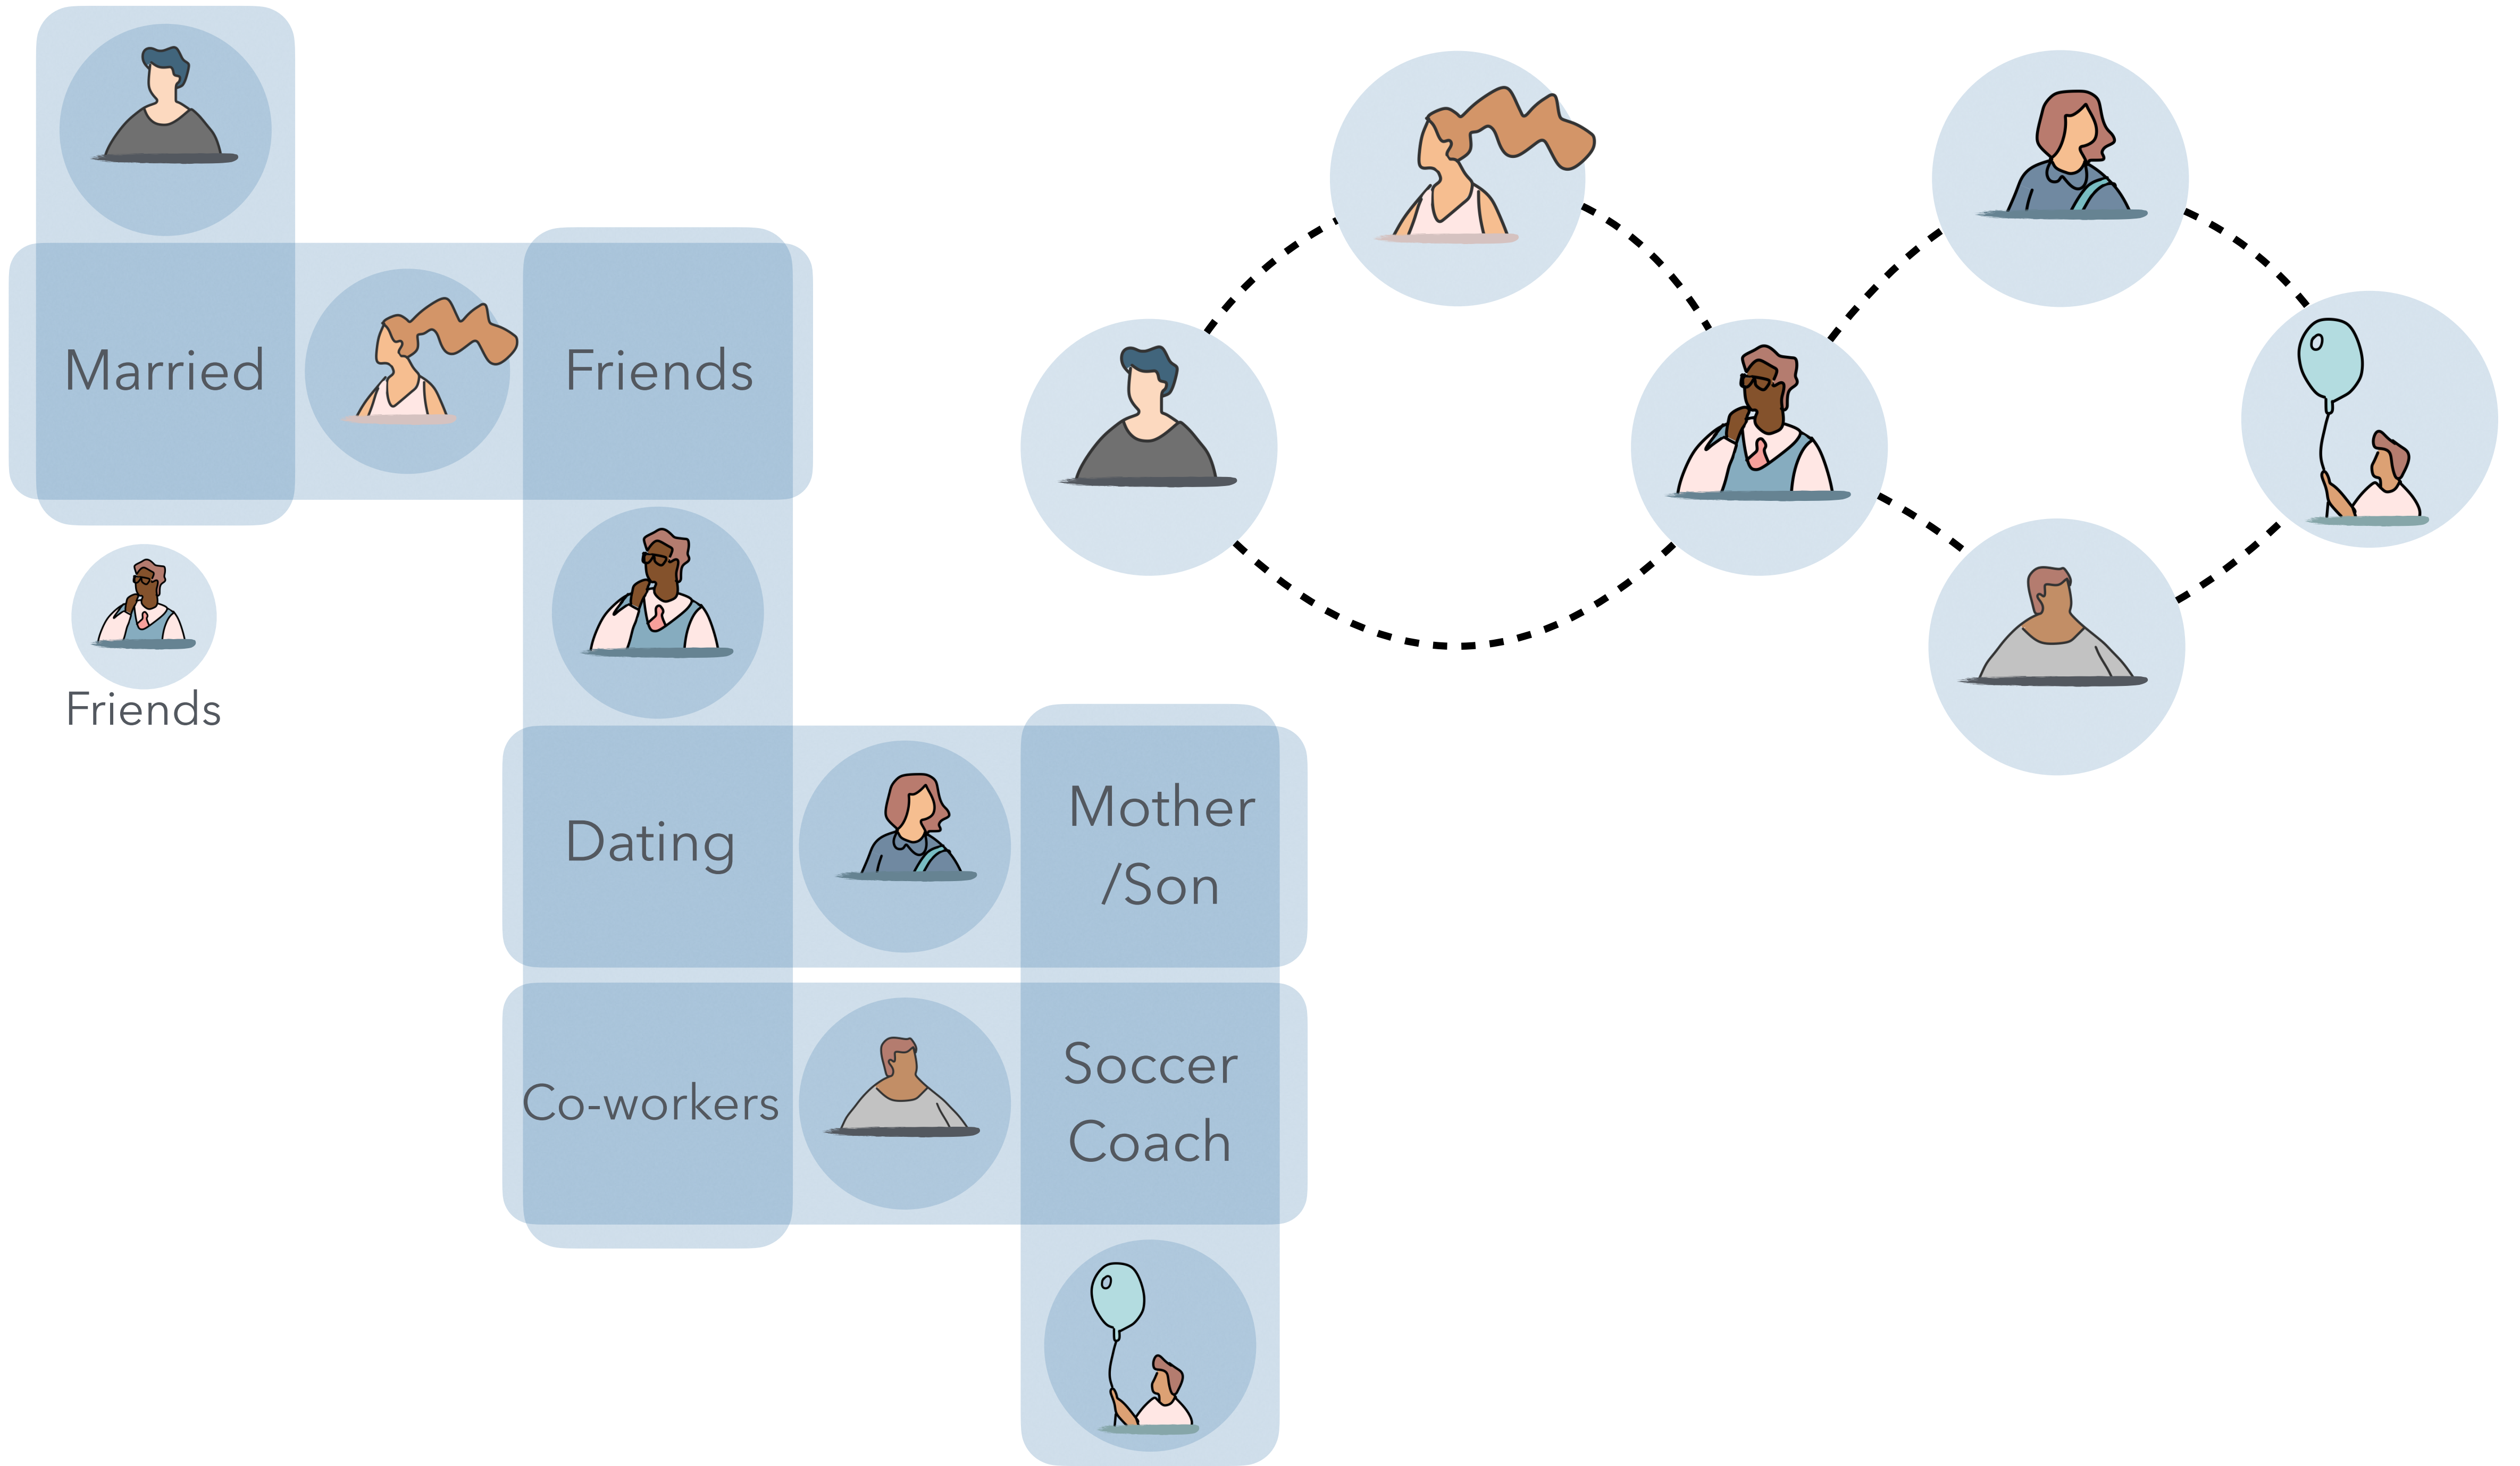

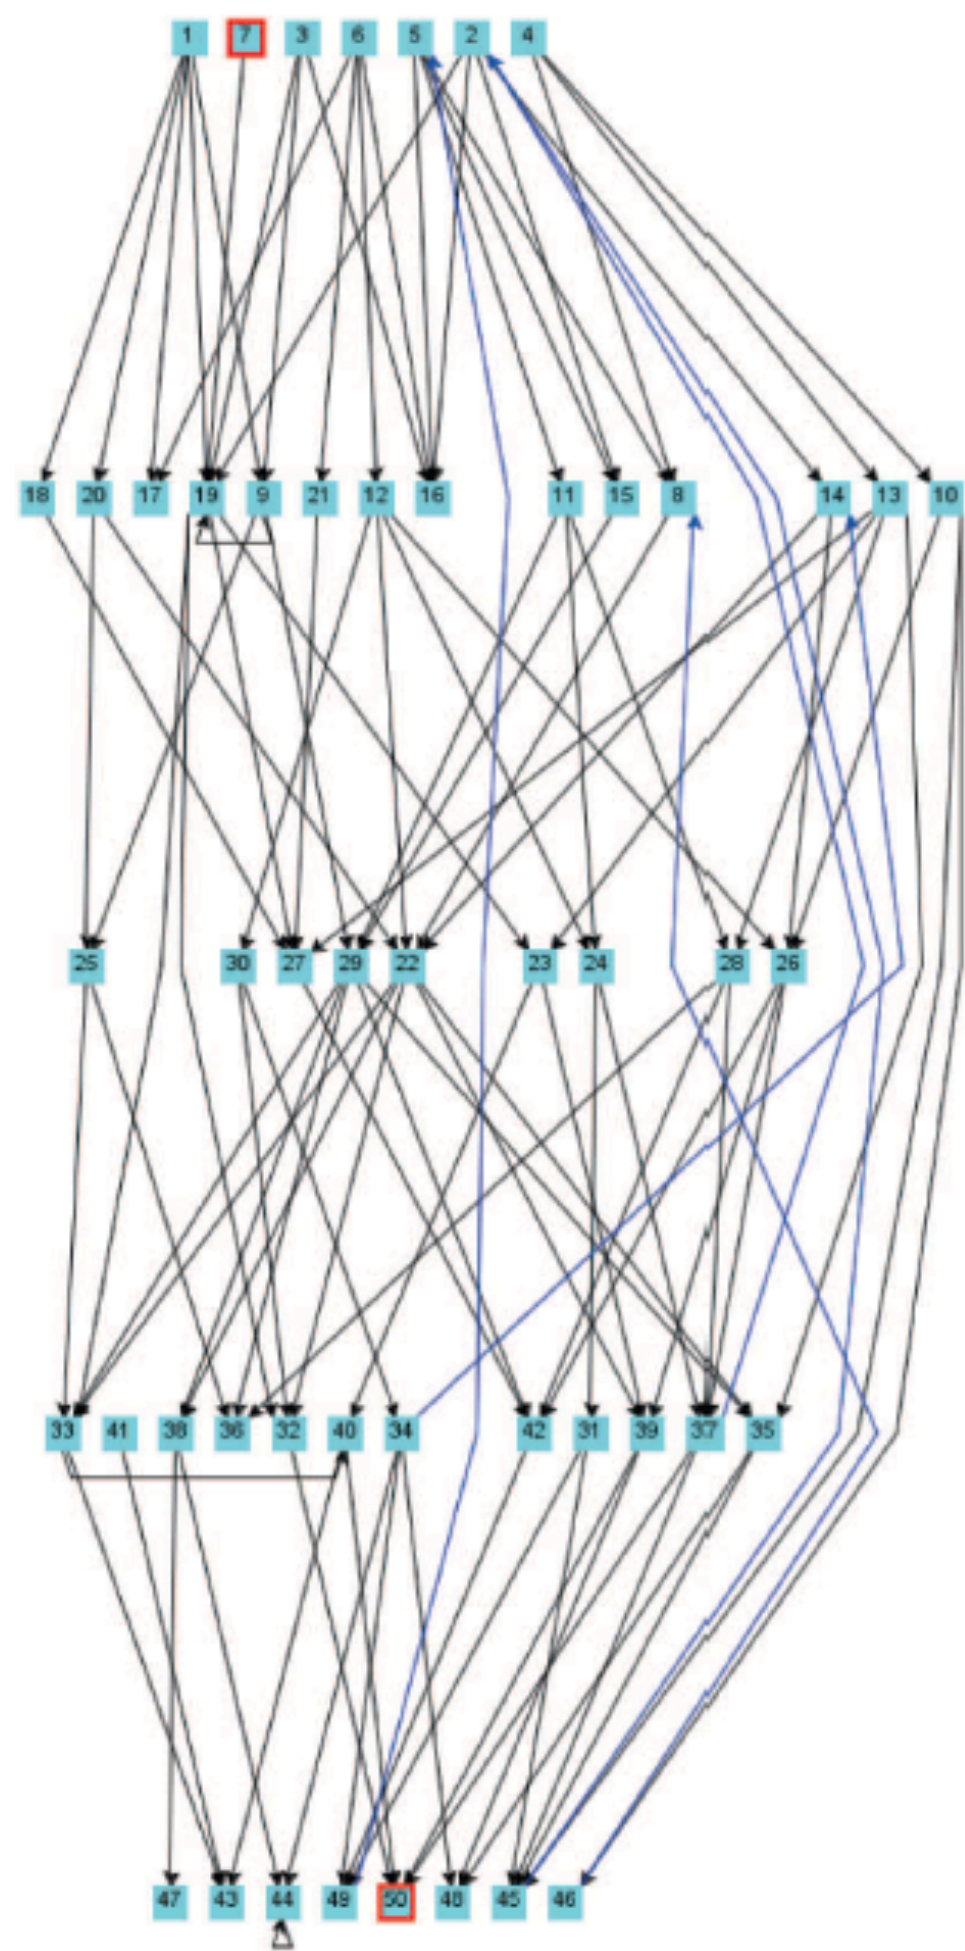

♀ Jacqueline	●
♂ Clancy	■
♀ Mona	●
♂ Abraham	■

F	F
---	---

●	♀ Patty	●
●	♀ Selma	●
●	♀ Marge	●
■	♂ Homer	■

F
---

■	♂ Bart
●	♀ Maggie
●	♀ Lisa

Well suited for layered networks

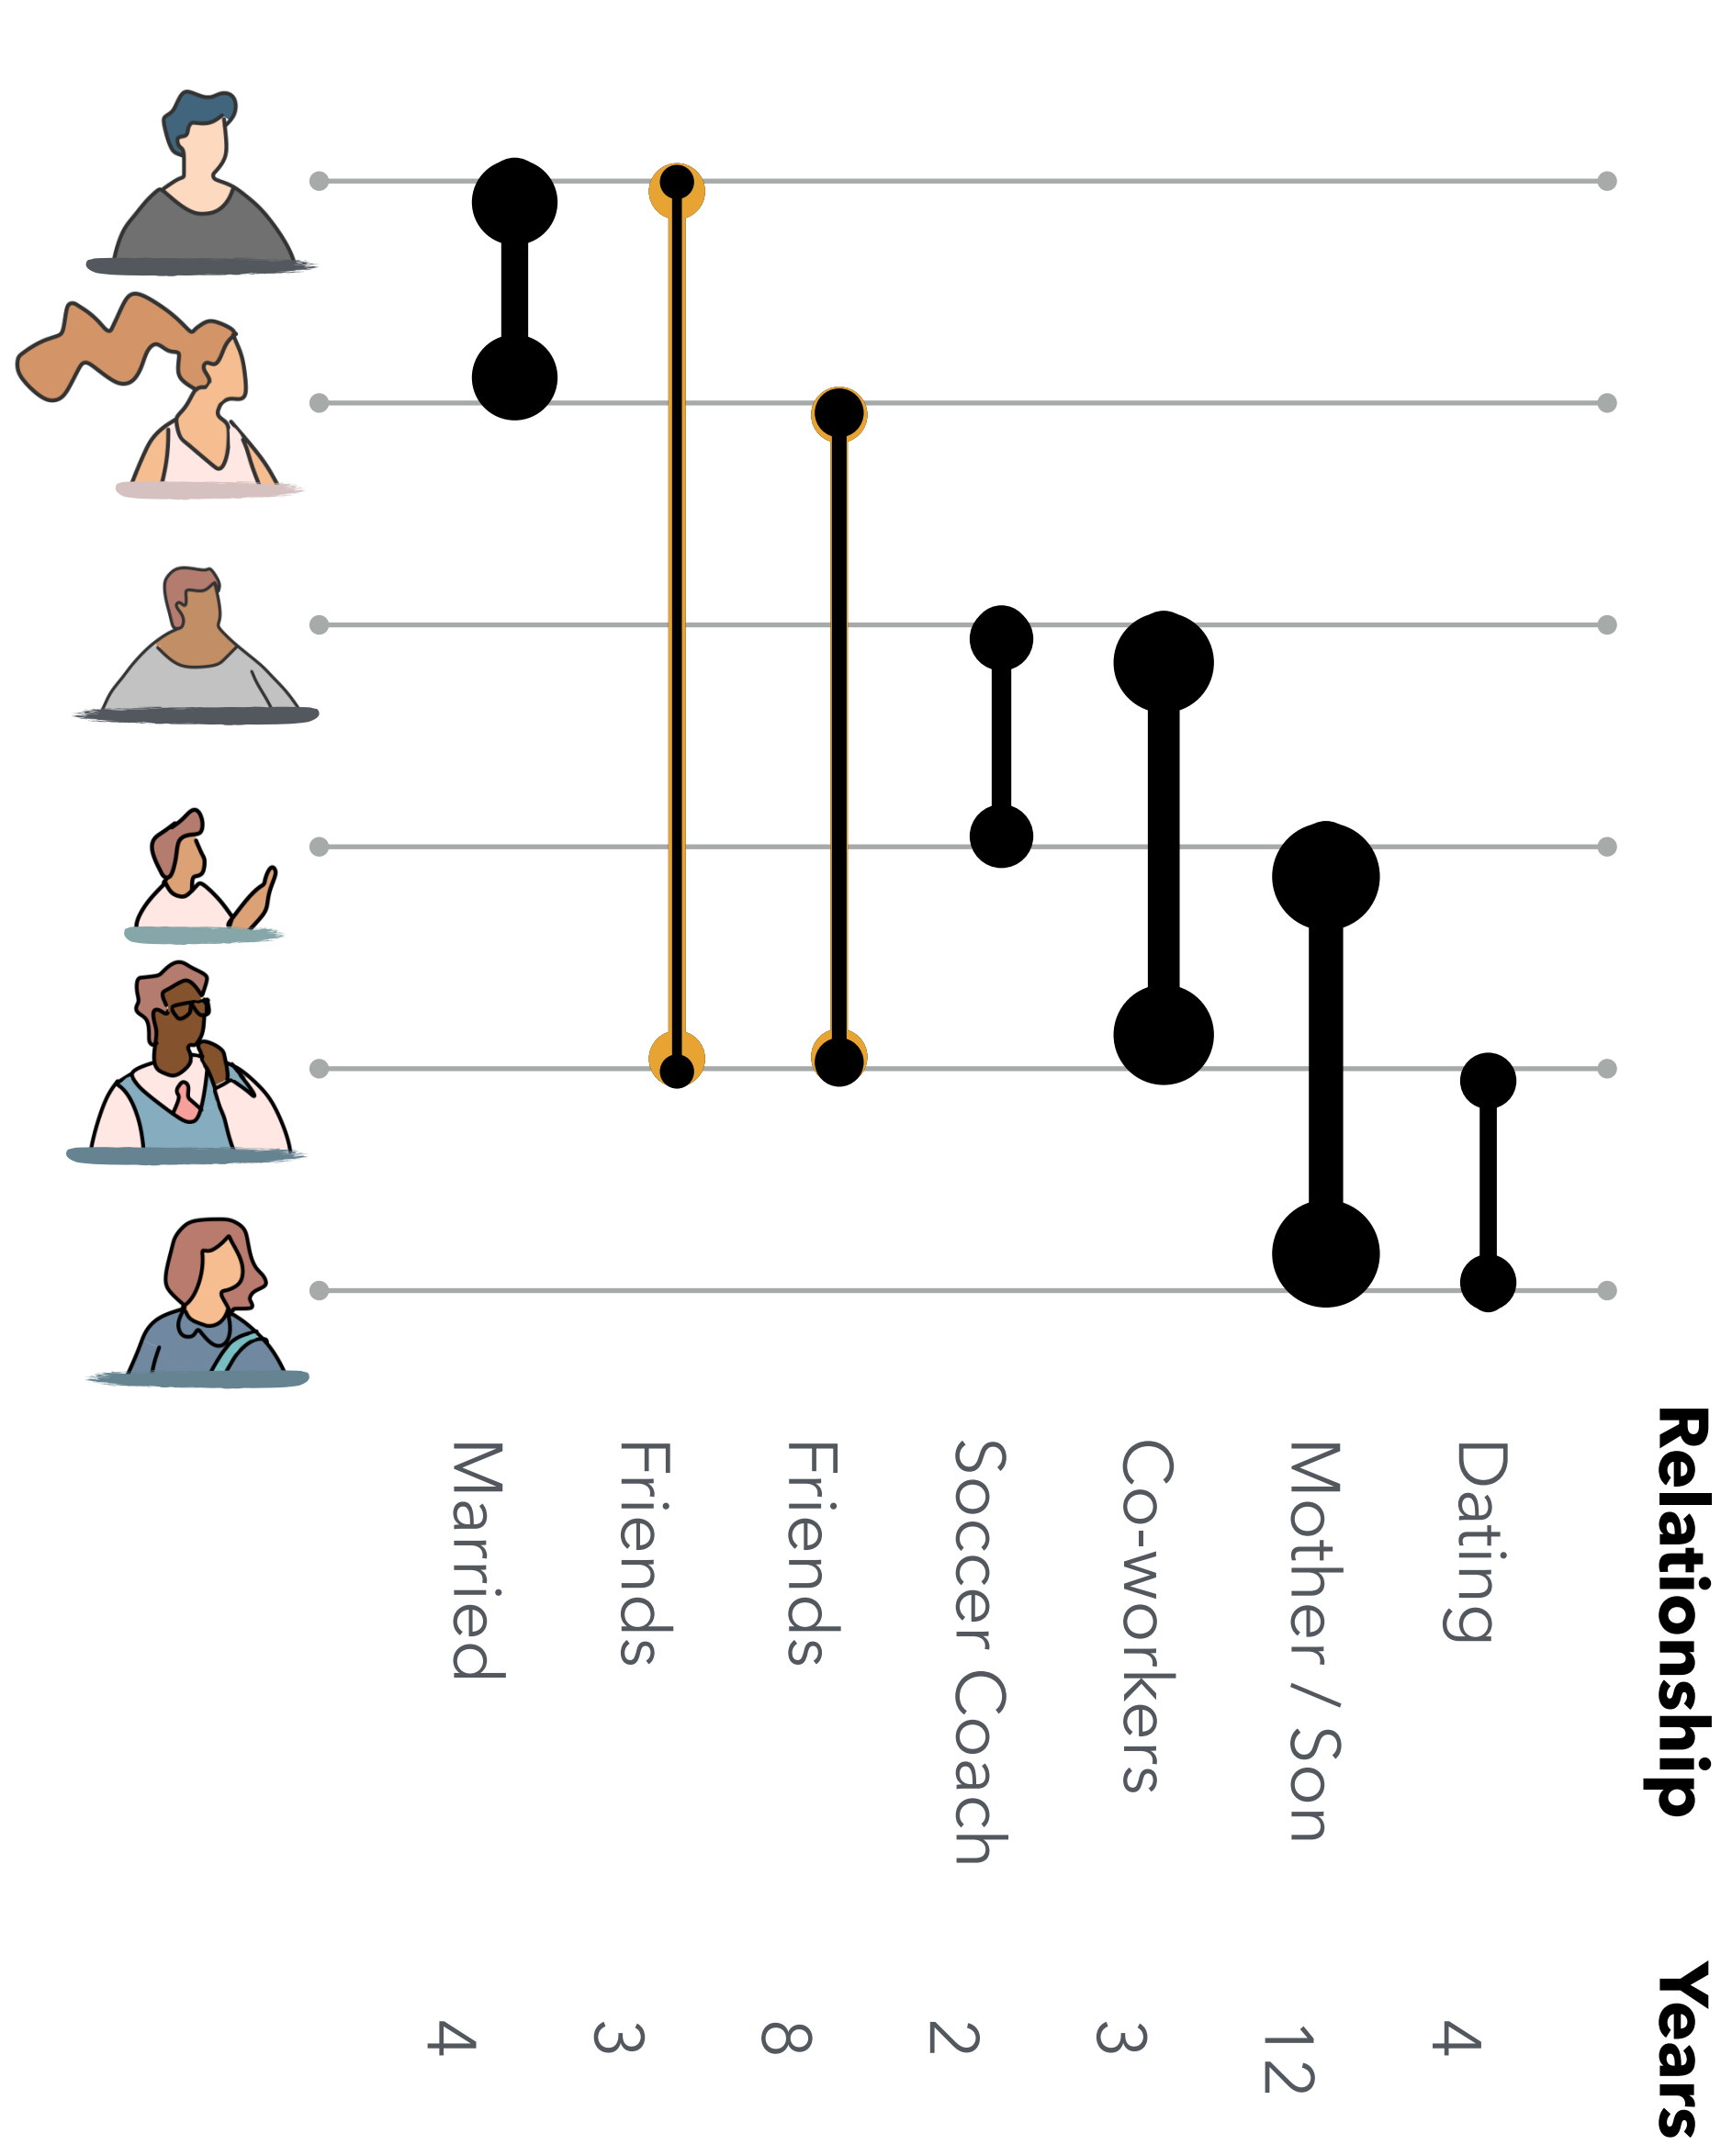

Links between nonconsecutive layers can be problematic to integrate and non-intuitive

*Recommended for layered or k-partite networks with limited skiplinks.*

BioFabric

*Longabaugh, 2012*

BioFabric

Can be used to visualize rich edge attributes and node attributes at the same time

More difficult to discover neighbors and clusters in Biofabric compared to matrices.

*Recommended for small, sparse networks with many nodes and rich edge attributes*

# Genea Quilts

The screenshot displays the Genea Quilts software interface. At the top, a timeline shows years 534, 1000, 1500, and 1992. Below the timeline is a grid representing a genealogical quilt. The grid is composed of rows and columns representing individuals. A vertical red line is drawn through the grid, and several horizontal red lines highlight specific rows. The names of individuals are listed on the left and right sides of the grid. A search panel on the right shows a search for 'Henry IV the Great' with the following results:

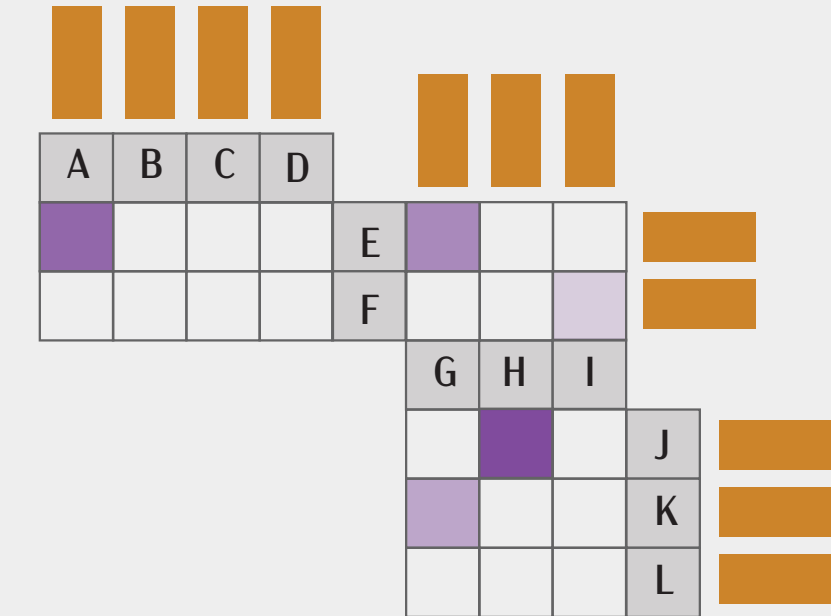

Attribute	Value
BIRT.DATE	13 DEC 1553
BIRT.PLAC	Pau,Navarre,France
BURI.PLAC	St. Denis,France

# Guo, 2009

Juxtaposed

Independent views can optimize for topology and attribute independently.

Not great for tasks on topological structures beyond a single node or edge.

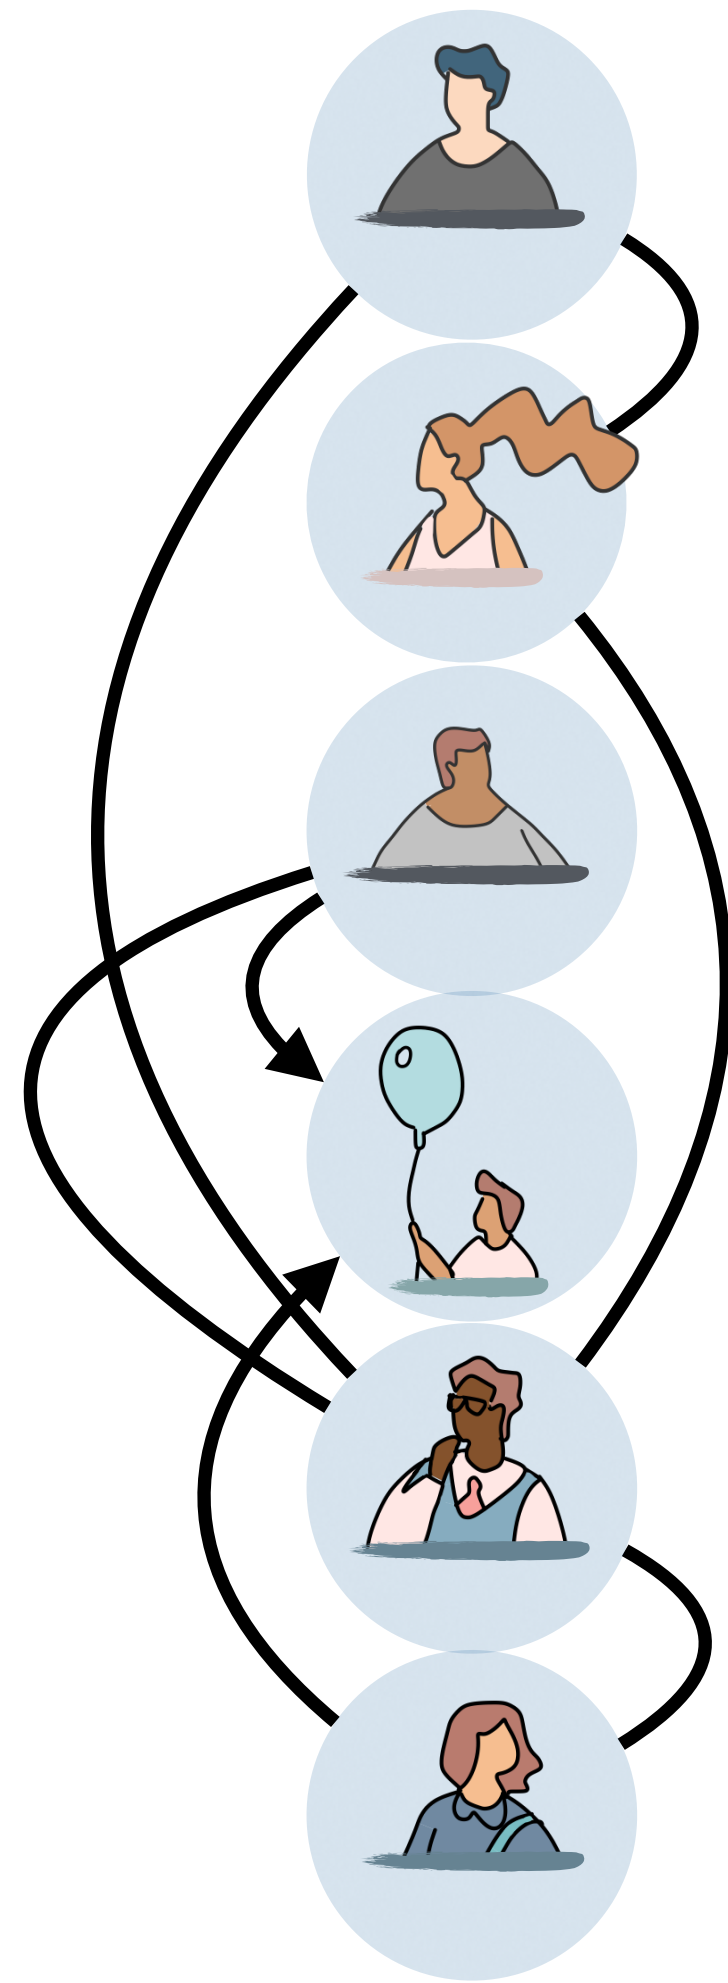

*Recommended for large networks and/or very large numbers or heterogeneous types of node and link attributes*

# Integrated

Georg Wilhelm Friedrich Hegel (IPA: [ˈɡeɔ̯k ˈvɪlhɛlm ˈfʁiːdʁɪç ˈheːɡəl]) (August 27, 1770 – November 14, 1831) was a German philosopher, and with Johann Gottlieb Fichte and Friedrich Wilhelm Joseph Schelling, one of the creators of German idealism. Hegel influenced writers of widely varying positions, including both his admirers (Bauer, Feuerbach, Marx, Bradley, Dewey, Sartre, Kung, Kojève, Žižek), and his detractors (Schelling, Kierkegaard, Schopenhauer, Nietzsche, Peirce, Russell). Hegel...

## About

This is a companion website for a review article on multivariate network visualization techniques.

Multivariate networks are networks where both the structure of the network and the attributes of the nodes and edges matter. It turns out, these are very common. Every person in a social network, for example, has both, relationships and lots of other characteristics, such as their age, the school they went to, or the city they live in. Multivariate network visualization techniques are designed to be able to show both, these attributes and the structure. Using these visualization techniques, we can analyze, for example, if a network of friends predominantly went to the same high school.

The visualization research community has developed many techniques to visualize these kinds of networks, and our review article – and this website – are designed to help you sort through these options.

Browse through the techniques illustrated below, or use our wizard to find the right multivariate network visualization technique for your datasets and tasks!

[Get in touch](#) if you have questions or comments.

## Use the Wizard

Technique recommendations to fit your needs!

Navigate to the [wizard tab](#) and select your specific network characteristics, such as the size of the network and its type, and what tasks are relevant for your analysis and receive technique recommendations that are best suited to your selection.
