The banana (*Musa acuminata*) genome and the evolution of monocotyledonous plants

Angélique D'Hont[1]*, France Denoeud[2,3,4]*, Jean-Marc Aury[2], Franc-Christophe Baurens[1], Françoise Carreel[1,5], Olivier Garsmeur[1], Benjamin Noel[2], Stéphanie Bocs[1], Gaëtan Droc[1], Mathieu Rouard[6], Corinne Da Silva[2], Kamel Jabbari[2,3,4], Céline Cardi[1], Julie Poulain[2], Marlène Souquet[1], Karine Labadie[2], Cyril Jourda[1], Juliette Lengellé[1], Marguerite Rodier-Goud[1], Adriana Alberti[2], Maria Bernard[2], Margot Correa[2], Saravanaraj Ayyampalayam[7], Michael R. Mckain[7], Jim Leebens-Mack[7], Diane Burgess[8], Mike Freeling[8], Didier Mbéguié-A-Mbéguié[9], Matthieu Chabannes[5], Thomas Wicker[10], Olivier Panaud[11], Jose Barbosa[11], Eva Hribova[12], Pat Heslop-Harrison[13], Rémy Habas[5], Ronan Rivallan[1], Philippe Francois[1], Claire Poiron[1], Andrzej Kilian[14], Dheema Burthia[1], Christophe Jenny[1], Frédéric Bakry[1], Spencer Brown[15], Valentin Guignon[1,6], Gert Kema[16], Miguel Dita[19], Cees Waalwijk[16], Steeve Joseph[1], Anne Dievart[1], Olivier Jaillon[2,3,4], Julie Leclercq[1], Xavier Argout[1], Eric Lyons[17], Ana Almeida[8], Mouna Jeridi[1], Jaroslav Dolezel[12], Nicolas Roux[6], Ange-Marie Risterucci[1], Jean Weissenbach[2,3,4], Manuel Ruiz[1], Jean-Christophe Glaszmann[1], Francis Quétier[18], Nabila Yahiaoui[1] & Patrick Wincker[2,3,4]

Bananas (*Musa* spp.), including dessert and cooking types, are giant perennial monocotyledonous herbs of the order Zingiberales, a sister group to the well-studied Poales, which include cereals. Bananas are vital for food security in many tropical and subtropical countries and the most popular fruit in industrialized countries[1]. The *Musa* domestication process started some 7,000 years ago in Southeast Asia. It involved hybridizations between diverse species and subspecies, fostered by human migrations[2], and selection of diploid and triploid seedless, parthenocarpic hybrids thereafter widely dispersed by vegetative propagation. Half of the current production relies on somaclones derived from a single triploid genotype (Cavendish)[1]. Pests and diseases have gradually become adapted, representing an imminent danger for global banana production[3,4]. Here we describe the draft sequence of the 523-megabase genome of a *Musa acuminata* doubled-haploid genotype, providing a crucial stepping-stone for genetic improvement of banana. We detected three rounds of whole-genome duplications in the *Musa* lineage, independently of those previously described in the Poales lineage and the one we detected in the Arecales lineage. This first monocotyledon high-continuity whole-genome sequence reported outside Poales represents an essential bridge for comparative genome analysis in plants. As such, it clarifies commelinid-

sequence errors. The assembly consisted of 24,425 contigs and 7,513 scaffolds with a total length of 472.2 Mb, which represented 90% of the estimated DH-Pahang genome size. Ninety per cent of the assembly was in 647 scaffolds, and the N50 (the scaffold size above which 50% of the total length of the sequence assembly can be found) was 1.3 Mb (Supplementary Text and Supplementary Tables 1–3). We anchored 70% of the assembly (332 Mb) along the 11 *Musa* linkage groups of the Pahang genetic map. This corresponded to 258 scaffolds and included 98.0% of the scaffolds larger than 1 Mb and 92% of the annotated genes (Supplementary Text, Supplementary Table 4 and Supplementary Fig. 1).

We identified 36,542 protein-coding gene models in the *Musa* genome (Supplementary Tables 1 and 5). A total of 235 microRNAs from 37 families were identified, including only one of the eight microRNA gene (*MIR*) families found so far solely in Poaceae[8] (Supplementary Tables 6 and 7).

Viral sequences related to the banana streak virus (BSV) dsDNA plant pararetrovirus were found to be integrated in the Pahang genome, with 24 loci spanning 10 chromosomes (Supplementary Text and Supplementary Fig. 2). They belonged to a badnavirus phylogenetic group that differed from the endogenous BSV species (eBSV) found in *M. balbisiana*[9] and most of them formed a new

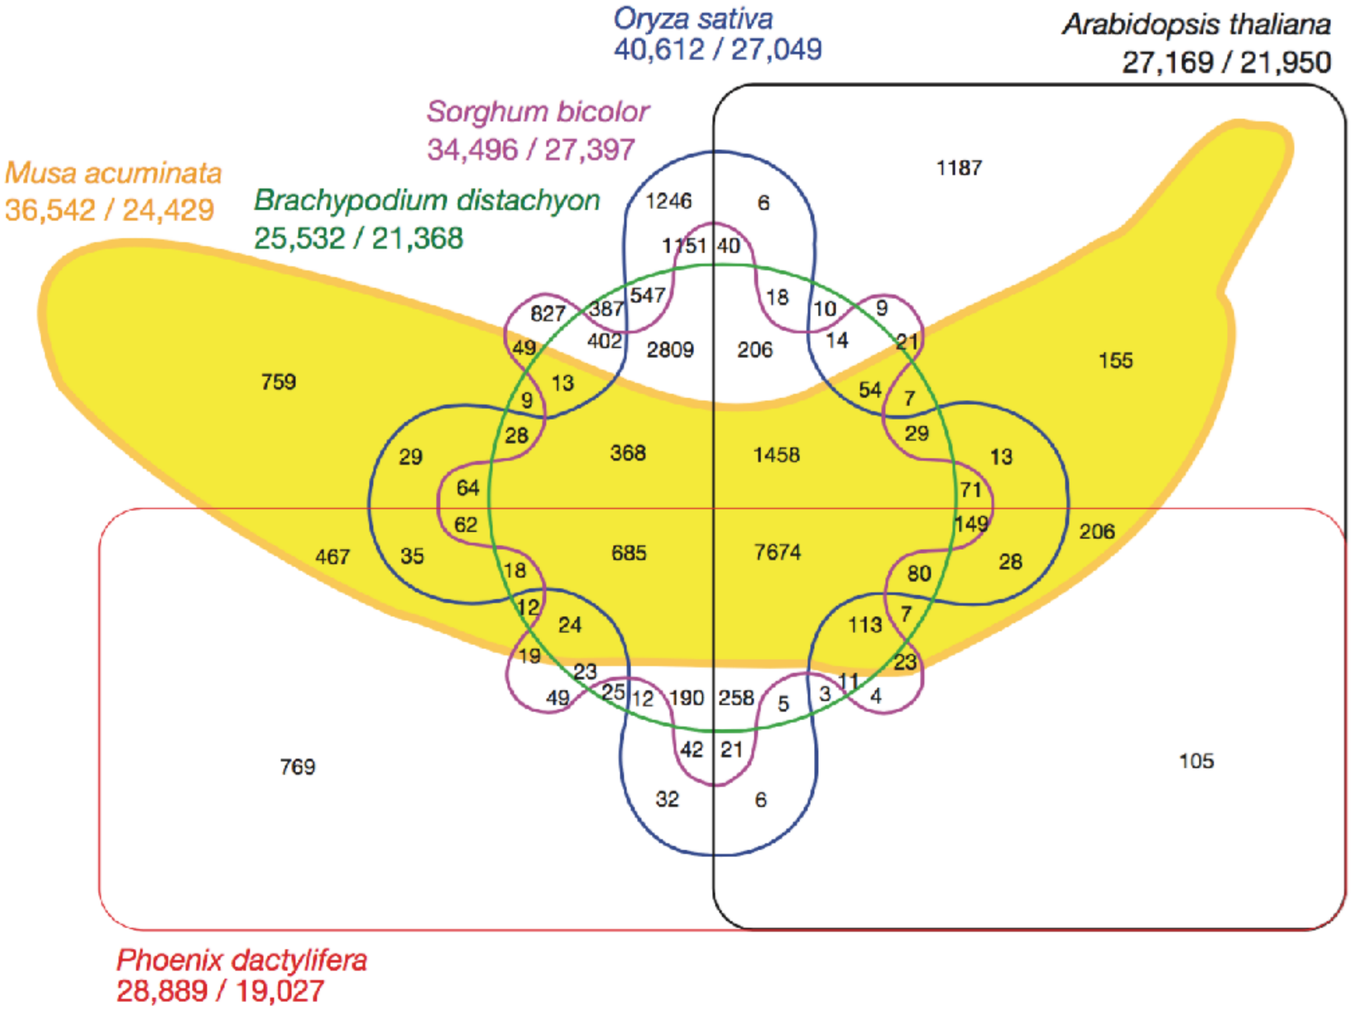

Figure 4 | Six-way Venn diagram showing the distribution of shared gene families (sequence clusters) among *M. acuminata*, *P. dactylifera*, *Arabidopsis thaliana*, *Oryza sativa*, *Sorghum bicolor* and *Brachypodium distachyon* genomes. Numbers of clusters are provided in the intersections. The total number of sequences for each species is provided under the species name (total number of sequences/total number of clustered sequences).

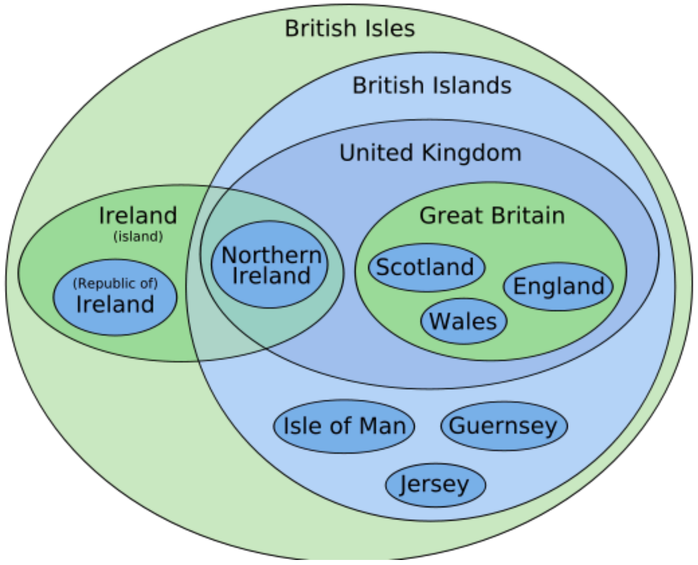
Venn and Euler Diagrams

Venn vs Euler

Euler Diagram

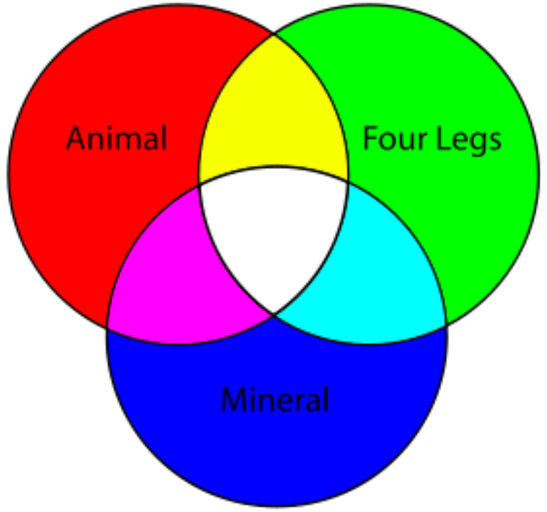
Shows logical relations

May omit empty intersections



Venn Diagram

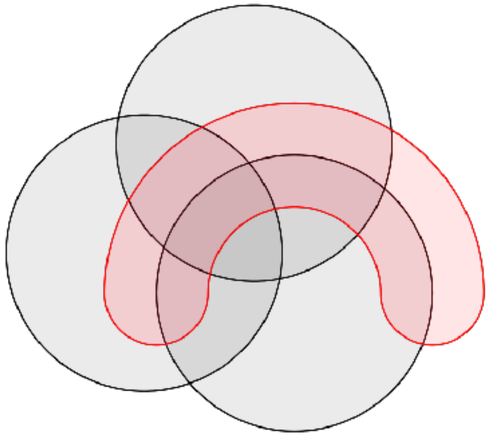
Shows all possible logical relations between sets (even if empty)

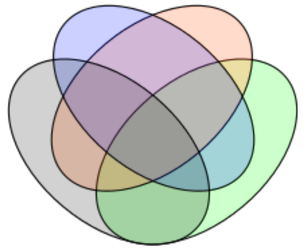


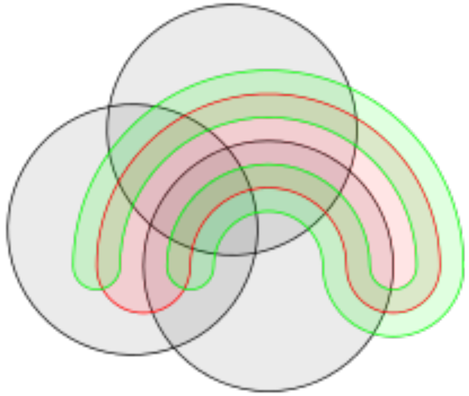
Venn Diagrams

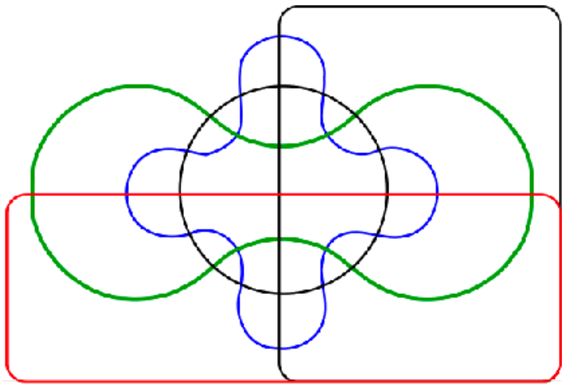
Venn diagrams for many sets are hard

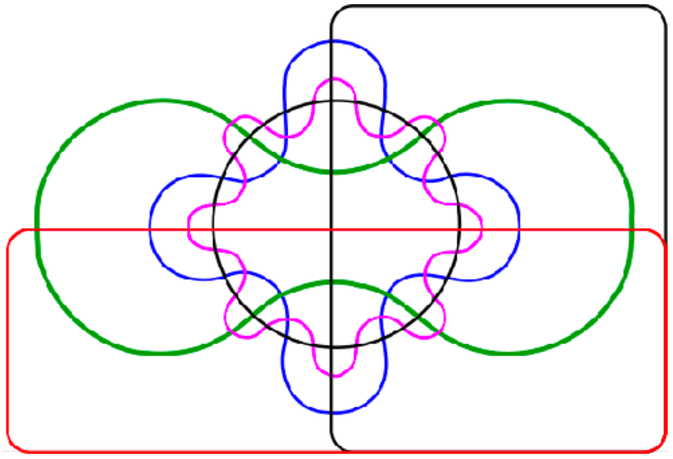
# of intersections is 2^n

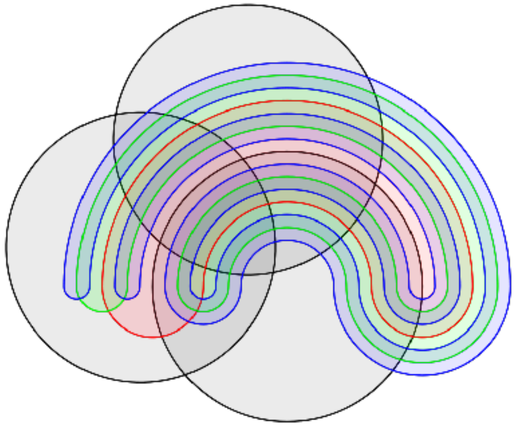


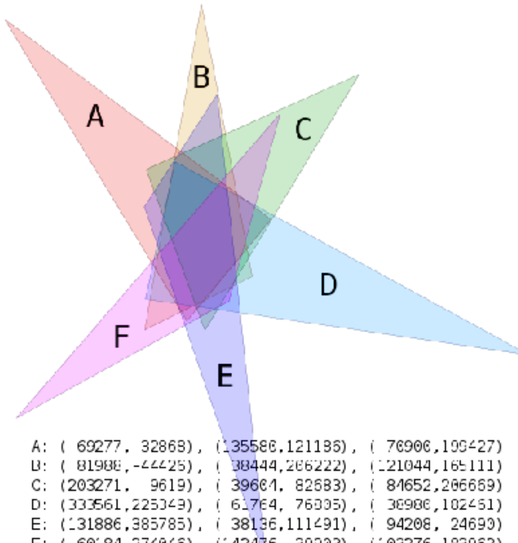












https://en.wikipedia.org/wiki/Venn_diagram

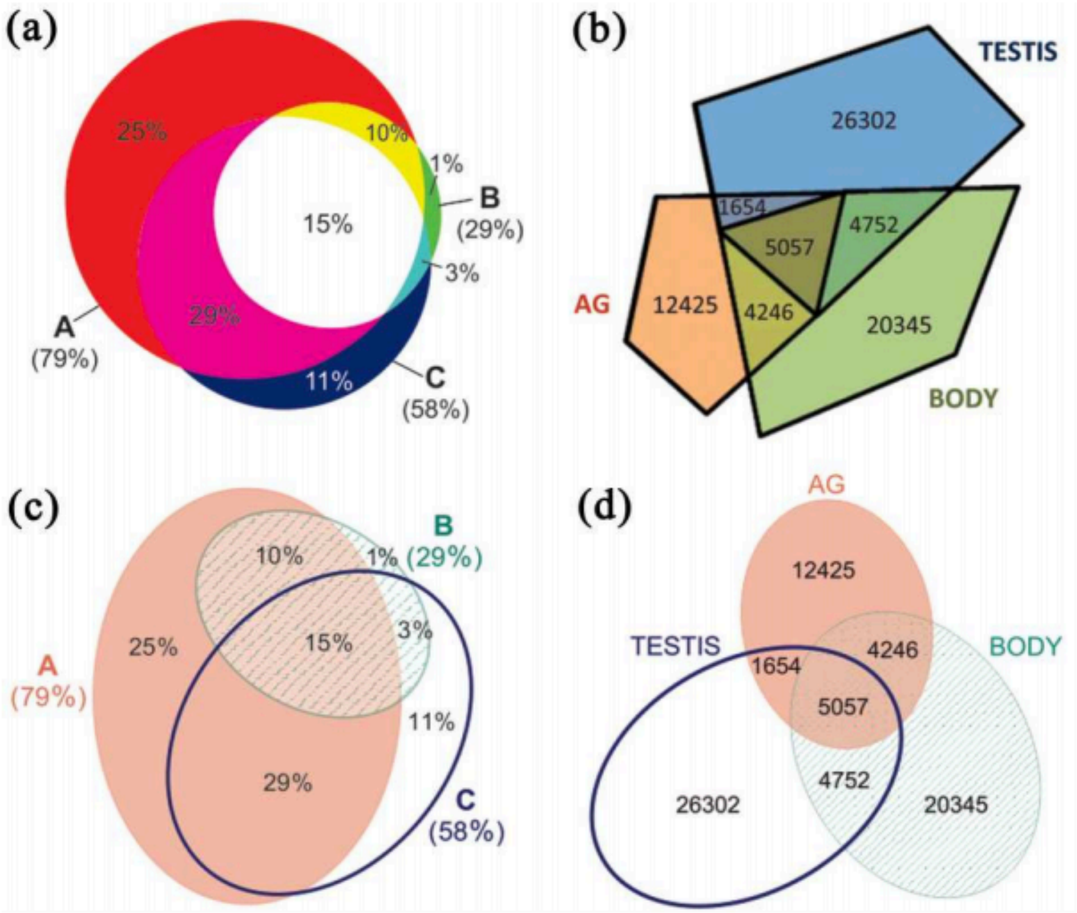
Area-Proportional Euler Diagrams

Problem with Venn: size doesn't correspond to the data.

Creating area-proportional Euler diagrams is hard.

Layout criteria:

- simple curves (circles are best)
  - makes it easy to identify which sets are participating in intersection
  - Gestalt-principle: good continuation
- area proportional



[Alsallakh 2015]

Compare Simple vs Complex Shape

Complex

Text and Document Visualization

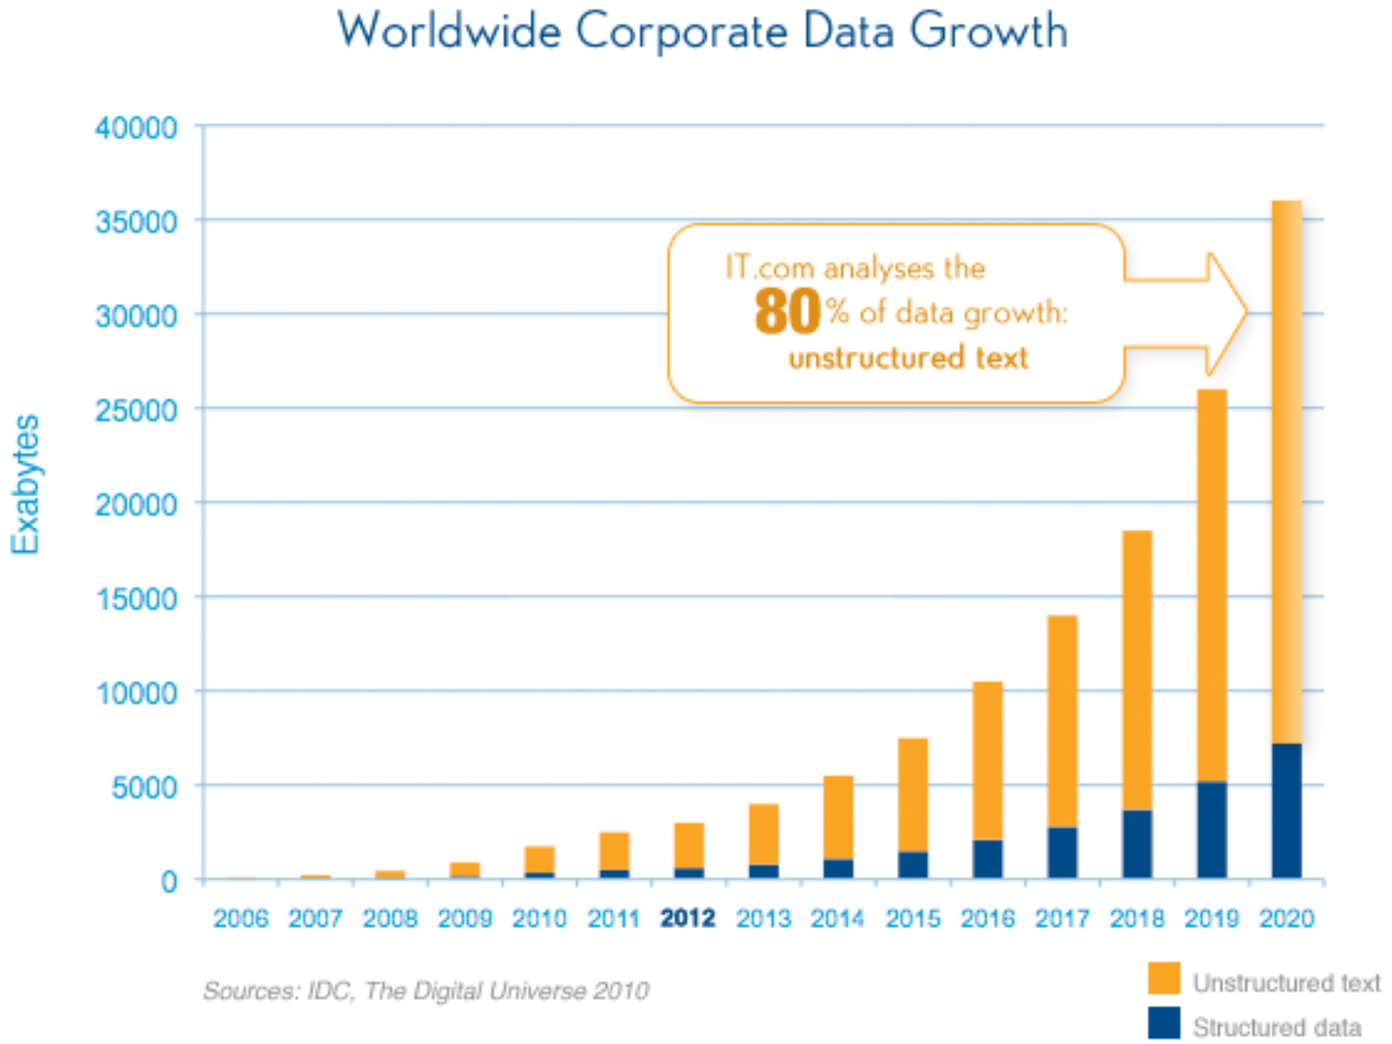
Slides adapted from Hendrik Strobelt

Text / Language

Features of Text as representation language

- abstract, general
- extremely expressive
- different across population groups
(countries, accents, religions,…)
- linear perception
- semi-structured (content: grammar, words, sentences, paragraphs,.. ; appearance: typography, calligraphy,..)

Why Visualize Text?



Design and Text

Typography:

- typefaces (serif, sans-serif, **bold**, *italic*)
- point size (10pt, 12pt, 24pt, 36pt..) line length (alignment: left, right, justified)
- vertical: line spacing (leading)
- horizontal: spaces between groups of letters (tracking)
- space between pairs of letters (kerning)
- combining letters to a glyph ligatures

Creating a font type is an art
that requires profound design knowledge

Document Thumbnails with Variable Text Scaling

A. Stoffel and H. Strobelt and O. Deussen and D. A. Keim

University of Konstanz, Germany

Abstract

Document reader applications usually offer an overview of the layout for each page as thumbnail view. Reading the text in these becomes impossible when the font size becomes very small. We improve the readability of these thumbnails using a distortion method, which retains a readable font size of interesting text while shrinking less interesting text further. In contrast to existing approaches, our method preserves the global layout of a page and is able to show context around important terms. We evaluate our technique and show application examples.

1. Motivation

The user interface of such as Adobe Reader , consists of a detail view and one or more views for navigation within documents , such as a table of contents , and a thumbnail view providing page previews . In addition , most document viewer offer a keyword search functionality where the occurrence of keywords is highlighted in the detail view . However , the navigation views of document viewers (e.g. thumbnails) typically do not show the occurrence of keywords in the document. So the user has to step through all occurrences of the keyword within the detail view as scrolling the pages .

To avoid this , we propose to highlight the keywords in the thumbnail view . Using the thumbnail view reduces the and the user is pointed pages . In addition , thumbnails can be useful for retrieval if the users are trying know [CvDRH99 , DC02]. Due to the small size of text in thumbnails , the highlighting should in addition increase the size of the keywords and their context , at first to make the text better readable and second to allow a simple disambiguation of keywords by their context . For instance , it about “user” or “user interface”keyword “user” would

The technique we present to create the thumbnails is a general distortion technique for document content that high - to a user defined interest

The global structure of a page , namely the position of im -

is used that highlights the keywords and their context . Other applications might use a different interest function , for instance a sentiment score could be used to create thumbnails for sentiment analysis .

2. Related Work

Three different techniques are currently used for handling document overview and navigation : abstraction from the document with pixel based representations , thumbnails with different highlighting techniques , and semantic zooming .

A common pixel based technique is TileBars [Hea95], which visualizes the length of documents and the distribution of search terms within these documents with a rectangular pixel-based visualization . Byrd [Byr99] combines the scrollbar of the document view with a pixel visualization of allowing the user to scroll rence of the terms . Both techniques do not show the context of the search terms and a user has to view in the detail view in order to access the context of the search terms .

Thumbnails , small version of the document or page , are commonly used for overview and navigation . The space-filling thumbnail approach of Cockburn et al. [CGA06] avoids scrolling in the overview of a document , by positioning the thumbnails of all pages on a grid on the screen and resizing the thumbnails to fit the window size . Suh et al. [SWRG02] combined the thumbnails with popouts , which highlgiht search terms by rendering them in a readable size with a semi-transparently colored background above

doc2	0	0	1

Typical Steps of Processing to derive Text Features

Large collections require pre-processing of text to extract information and align text.
Typical steps are:

- cleaning (regular expressions)
- sentence splitting
- change to lower case
- stopword removal (most frequent words in a language)
- stemming - demo porter stemmer
- POS tagging (part of speech) - demo
- noun chunking
- NER (name entity recognition) - demo opencalais
- deep parsing - try to “understand” text.

Text features are complicated

Toilet out of order. Please use floor below.

One morning I shot an elephant in my pajamas. How he got in my pajamas, I don't know.

Did you ever hear the story about the blind carpenter who picked up his hammer and saw?

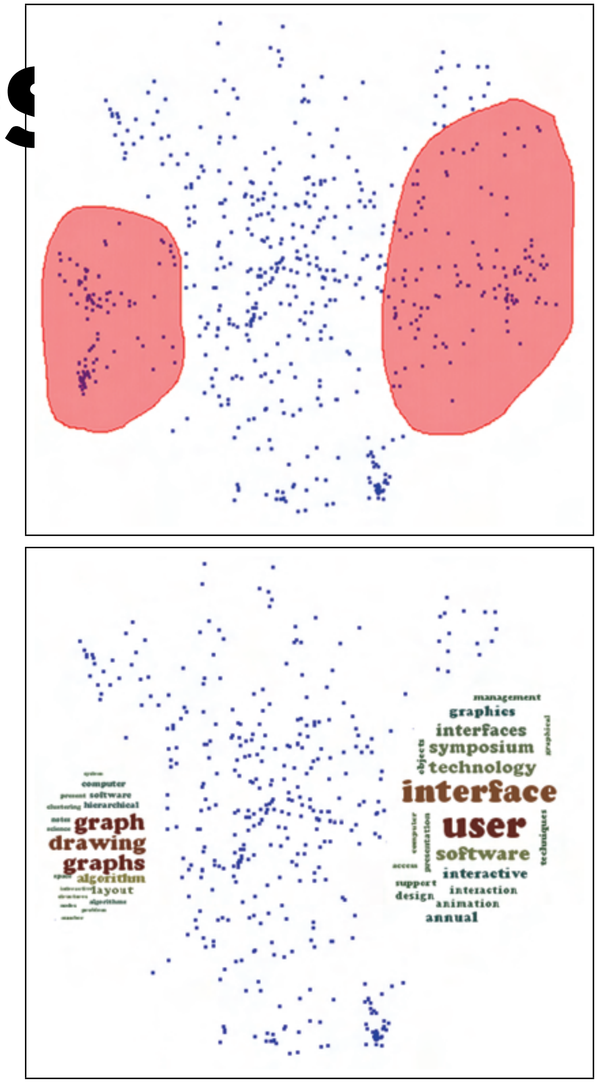
Corpora: MDS Approaches

use bag-of-word to project documents w.r.t. text similarity into a landscape

(only) one example



Fernando V. Paulovich, Franklina M. B. Toledo, Guilherme P. Telles, Rosane Minghim, and Luis Gustavo Nonato.
Semantic Wordification of Document Collections.
Comp. Graph. Forum 31, 3pt3 (June 2012)

Figure 5: *A user can interactively draw a region (polygon) containing a subset of documents of interest (top figure). Keywords are extracted from the selected document and their corresponding word could is built inside the user-defined region (bottom figure).*
